PANHANDLE RESEARCH STATION PROGRESS REPORT - 1969, GOODWELL, CKLAHOMA.
W71-08149 03F

LAHOMA STATE UNIV., STILLWATER.
THE MINIMUM OXYGEN REQUIREMENTS OF FIVE SPECIES OF FISH UNDER QUIESCENT CONDITIONS,
W71-07735 05C

KINETIC CONSTANTS FOR AEROBIC GROWTH OF MICROBIAL POPULATIONS SELECTED WITH VARIOUS SINGLE COMPOUNDS AND WITH MUNICIPAL WASTES AS SUBSTRATES,
W71-07766 05D

LAHOMA STATE UNIV., STILLWATER. DEPT. OF AGRONOMY.
THE INTERACTIONS OF CU66 AND CW- WITH PARAQUAT PHYTOTOXICITY TO A CHLORELLA,
W71-07881 05C

LAHOMA UNIV., NORMAN. BUREAU OF WATER RESOURCES RESEARCH.
DEMONSTRATING THE EFFECTS OF NUTRIENTS IN BIO-OXIDATION POND RECEIVING STREAMS,
W71-07973 05C

TARIO DEPT. OF AGRICULTURE AND FOOD, TORONTO.
THE ECONOMICS OF ALTERNATIVE METHODS OF WHEY DISPOSAL AT SOUTHERN ONTARIO CHEESE FACTORIES,
W71-08021 05G

TARIO PAPER CO., LTD., THOROLD.
A NOVEL ION EXCHANGE PROCESS FOR CHEMICAL RECOVERY AND POLLUTION ABATEMENT,
W71-08007 05D

TARIO RESEARCH FOUNDATION, SHERIDAN PARK.
REVERSE OSMOSIS-A REVIEW OF ITS APPLICATIONS TO WASTE TREATMENT,
W71-08006 05D

TARIO RESEARCH FOUNDATION, TORONTO.
RECLAMATION OF POTABLE WATER FROM DOMESTIC SEWAGE,
W71-07779 05D

TARIO WATER RESOURCES COMMISSION, TORONTO.
BIOLOGICAL SURVEY OF THE EFFECTS OF URANIUM MILLING WASTES ON THE WATER QUALITY OF THE SERPENT RIVER BASIN,
W71-08011 05D

EGON STATE UNIV., CORVALLIS.
BACKGROUND STUDY FOR POND COOLING FOR INDUSTRY,
W71-08318 05C

EGON UNIVERSITY, EUGENE, OREGON AND SACRAMENTO STATE LLEGE, SACRAMENTO, CALIFORNIA.
CAPITAL BUDGETING A MODIFIED APPROACH TO CAPITAL ALLOCATION,
W71-08295 06B

AR MAYER, AND CO., ASILOMAR, CALIF.
MANAGEMENT DECISIONS IN SOLVING WASTE WATER PROBLEMS,
W71-07770 05D

LO UNIV. (NORWAY). INST. OF MARINE BIOLOGY.
ZOOPLANKTON, ZOOBENTHOS, AND BOTTOM SEDIMENTS AS RELATED TO POLLUTION AND WATER EXCHANGE IN THE OSLOFJORD,
W71-07729 05C

BRIEN AND GERE, SYRACUSE, N.Y.
PILOT PLANT STUDIES ON COMBINED DOMESTIC AND PAPER MILL WASTES,
W71-08017 05D

NNSYLVANIA DEPT. OF HEALTH, HARRISBURG. DIV. OF WATER ALITY.
DEVELOPING AND APPLYING STANDARDS AT THE STATE LEVEL,
W71-08308 05G

NNSYLVANIA STATE UNIV., UNIVERSITY PARK.
ESTICIDES IN THE ANTARCTIC,
W71-07906 05C

NNSYLVANIA UNIV., PHILADELPHIA.
HE SPECIFICATION OF REGIONAL ECONOMETRIC MODELS,
W71-08278 06A

LINER CORP., SARINA (ONTARIO).
SEWER FLOW MEASUREMENT IN A LARGE INDUSTRIAL PLANT,
W71-08020 05G

RTLAND STATE UNIV., OREGON. DEPT. OF GEOGRAPHY.
HE COLLAPSE OF SOLIFLUCTION LOBES AS A FACTOR IN VEGETATION BLOCKFIELDS,
W71-07954 02C

NCE GEORGE PULP AND PAPER LTD. (BRITISH COLUMBIA).
BIOLOGICAL TREATMENT OF BLEACH PLANT WASTES,
W71-07999 05D

NCETON UNIV., N.J.
N THE APPROPRIATE DISCOUNT RATE FOR EVALUATION OF PUBLIC PROJECTS,
W71-08269 06B

NCETON UNIV., N.J. DEPT. OF GEOLOGICAL AND GEOPHYSICAL IENCES.
IRON IN THE MULLICA RIVER AND IN GREAT BAY, NEW JERSEY,
W71-08089 02L

BLIC HEALTH ENGINEERING LAB., JODHPUR (INDIA) INDIAN ASSLAND AND FODDER RESEARCH INST., JHANSI (INDIA) AND

CENTRAL ARID ZONE RESEARCH INST., JODHPUR (INDIA).
NATURAL LEACHING OF THE HIGHLY SALT AFFECTED SOILS OF WESTERN RAJASTHAN,
W71-08071 02G

PUBLIC HEALTH SERVICE, CINCINNATI, OHIO. CONTROL TECHNOLOGY BRANCH.
QUALITY VERSUS RESIDUAL CHLORINE,
W71-07768 05F

PUBLIC SERVICE CO. OF NEW HAMPSHIRE, MANCHESTER.
THE POWER INDUSTRY AND THE ENVIRONMENT,
W71-08299 05B

PURDUE UNIV., LAFAYETTE, IND.
ECONOMIC THEORY AND RESOURCE POLICY,
W71-08274 06B

PURDUE UNIV., LAFAYETTE, IND. DEPT. OF GEOSCIENCES AND TORONTO UNIV. (ONTARIO). DEPT. OF CIVIL ENGINEERING.
COMPUTER DETERMINATION OF THE GEOMETRY AND TOPOLOGY OF STREAM NETWORKS,
W71-07911 07A

PURDUE UNIV., LAFAYETTE, IND. DEPT. OF GEOSCIENCES AND PURDUE UNIV., LAFAYETTE, IND. LAB. FOR APPLICATION OF REMOTE SENSING.
THERMAL MAPPING OF STREAMS FROM AIRBORNE RADIOMETRIC SCANNING,
W71-08061 07B

PURDUE UNIV., LAFAYETTE, IND. WATER RESOURCES RESEARCH CENTER.
PEDOLOGIC FEATURES OF RESERVOIR SEDIMENTATION,
W71-07702 02H

QUEENSLAND LITTORAL SOCIETY, BRISBANE (AUSTRALIA).
OIL EXPLORATION ON GREAT BARRIER REEF,
W71-08156 05G

RAND CORP., SANTA MONICA, CALIF.
PROFESSIONAL DECISION-MAKING,
W71-08276 06B

RCA CORP., LTD., MIDLAND (ONTARIO).
OPERATIONAL GROWING PAINS OF AN INDUSTRIAL WASTE TREATMENT PLANT,
W71-08014 05D

ROAD RESEARCH LAB., CROWTHORNE, ENGLAND, CLIMATE AND ENVIRONMENT SECTION.
SNOW FENCES,
W71-08069 02C

ROCKY MOUNTAIN FOREST AND RANGE EXPERIMENTAL STATION, TEMPE, ARIZ. HYDROLOGY LAB.
REDUCING EXCESS READOUTS FROM DIGITAL STREAMFLOW RECORDERS,
W71-07914 07C

ROHM AND HAAS CO., DEER PARK, TEX.
WATER POLLUTION CONTROL AT THE ROHM AND HAAS HOUSTON PLANT,
W71-07773 05D

ROSENSTIEL SCHOOL OF MARINE AND ATMOSPHERIC SCIENCES, MIAMI, FLA.
EFFECTS OF DIELDRIN ON GLUTAMIC OXALOACETIC TRANSAMINASE IN POECILIA LATIPINNA,
W71-07733 05C

RUTGERS-THE STATE UNIV., NEW BRUNSWICK, N.J. WATER RESOURCES RESEARCH INST.
AERATOR PERFORMANCE IN NATURAL STREAMS,
W71-07885 05G

RYCKMAN, EDGERLY, TOMLINSON AND ASSOCIATES, INC., ST. LOUIS, MO.
PHOSPHATE REMOVAL BY ACID HYDROLYSIS AND CHEMICAL PRECIPITATION,
W71-08022 05D

SACRAMENTO STATE COLL., CALIF. DEPT. OF CIVIL ENGINEERING.
DETERMINATION OF FLOTABLE SUBSTANCES IN WASTE WATER,
W71-07764 05D

SAN DIEGO GAS AND ELECTRIC CO., CALIF.
PRACTICAL PROBLEMS IN COMBINING ELECTRIC POWER PRODUCTION WITH SEA WATER DESALINATION,
W71-07833 08C

SARGENT AND LUNDY, CHICAGO, ILL.
NATURAL BODIES OF WATER FOR COOLING,
W71-08313 05D

SASKATCHEWAN UNIV., REGINA. DEPT. OF GEOGRAPHY.
LIMESTONE SOLUTION WITHIN THE EAST MENDIP AREA, SOMERSET,
W71-08116 02F

SCIENTIFIC COMMITTEE ON OCEANIC RESEARCH AND INTERNATIONAL COUNCIL FOR THE EXPLORATION OF THE SEA, HYDROGRAPHY COMMITTEE AND INTERNATIONAL ASSOCIATION OF THE PHYSICAL SCIENCES OF THE OCEAN.
REDEFINITION OF SALINITY,
W71-07874 02L

SECRETARY OF AGRICULTURE, WASHINGTON, D.C.
ASSOCIATION LOAN AND GRANT ASSISTANCE FOR SOIL AND WATER FACILITIES, INCLUDING WASTE DISPOSAL, RECREATION, GRAZING, AND OTHER FACILITIES.
W71-07711 06E

SHELL CANADA LTD., CORUNNA (ONTARIO).

A MANAGEMENT ATTITUDE TOWARDS WATER CONSERVATION,
W71-08001 05G

SIMON FRASER UNIV., BURNABY (BRITISH COLUMBIA) AND LONDON UNIV. (ENGLAND).
CHOICE IN WATER USE,
W71-08293 06B

SLOAN-KETTERING INST. FOR CANCER RESEARCH, NEW YORK AND MOUNT DESERT ISLAND BIOLOGICAL LAB., SALISBURY COVE, ME.
STUDIES ON 2-PIPERIDINO-8-MERCAPTOADENINE, A POTENT INHIBITOR OF CLEAVAGE IN ECHINODERM EMBRYOS,
W71-07902 05C

SLOVAK TECHNICAL UNIV., BRATISLAVA (CZECHOSLOVAKIA) AND MAGYAR TUDOMANYOS AKADEMIA KOZPONTI FIZIKAI KUTOTO INTEZETE, BUDAPEST.
ACTIVATION ANALYSIS BY CHARGED PARTICLES (IN SLOVAK),
W71-07886 07B

SMITHSONIAN INSTITUTION, WASHINGTON, D.C. DEPT. OF INVERTEBRATE ZOOL AND BERMUDA BIOLOGICAL STATION, ST. GEORGE'S WEST.
OIL POLLUTION. DAMAGE OBSERVED IN TROPICAL COMMUNITIES ALONG THE ATLANTIC SEABOARD OF PANAMA,
W71-07908 05C

SOIL CONSERVATION SERVICE, BERKELEY, CALIF. WATERSHED PLANNING PARTY.
THE CHANCE A FLOOD WILL BE EXCEEDED IN A PERIOD OF YEARS,
W71-08058 06A

SOIL CONSERVATION SERVICE, PHOENIX, ARIZ.
SUMMARY OF SNOW SURVEY MEASUREMENTS FOR ARIZONA AND PERTINENT PORTIONS OF NEW MEXICO 1939-1970,
W71-08076 02C

SOUTH CAROLINA POLLUTION CONTROL AUTHORITY, COLUMBIA.
WATER CLASSIFICATION STANDARDS SYSTEM FOR THE STATE OF SOUTH CAROLINA.
W71-07710 06E

SOUTHERN ILLINOIS UNIV., CARBONDALE.
THE ECONOMIC AND SOCIAL IMPLICATIONS OF SNOW AND ICE,
W71-08291 06B

STANFORD UNIV., CALIF.
CAPITAL BUDGETING, A QUANTITATIVE EVALUATION OF INVESTMENT ALTERNATIVES,
W71-08289 06B

UNIQUENESS OF THE INTERNAL RATE OF RETURN WITH VARIABLE LIFE OF INVESTMENT,
W71-08294 06C

STATE INST. FOR MINED CHEMICAL RAW MATERIAL, LYUBERTSY, (USSR) AND AKADEMIYA NAUK SSSR, MOSCOW. INSTITUT GEOKHIMII I ANALITICHESKOI KHIMII.
FORMATION CONDITIONS OF SULPHUR-BEARING MUDS IN CURRENT CRATER LAKES,
W71-07945 02H

STATE INST. OF HYDROLOGY AND METEOROLOGY, WARSAW (POLAND).
EVALUATION OF THE WATER BALANCE OF AN INTERCONNECTED GROUP OF LAKES AS ILLUSTRATED BY THE GREAT MASURIAN LAKES,
W71-08111 02H

STOCKHOLM UNIV. (SWEDEN). ASKO LAB. AND STOCKHOLM UNIV. (SWEDEN). DEPT. OF ZOOLOGY.
POPULATION DYNAMICS AND SALINITY TOLERANCE OF HYADESIA FUSCA (LOHMAN) (ACARINA, SARCOPTIFORMES) FROM BRACKISH WATER ROCKPOOLS, WITH NOTES ON THE MICROENVIRONMENT INSIDE ENTEROMORPHA TUBES,
W71-08026 05C

TABELA HOUSE, KOTA (INDIA). AGRICULTURAL CHEMISTRY SECTION.
A STUDY ON CHANGES IN QUALITY OF UNDERGROUND WATER,
W71-08073 05B

TECHNICAL UNIV. OF DENMARK, LYNGBY. DEPT. OF SANITARY ENGINEERING.
FIELD DETERMINATION OF BACTERIAL DISAPPEARANCE IN SEAWATER,
W71-08160 05A

TECHNISCHE HOCHSCHULE, DARMSTADT (WEST GERMANY).
THE ECONOMICS OF POLLUTION AND THE INTERDISCIPLINARY APPROACH TO ENVIRONMENTAL PLANNING,
W71-08264 06A

TEL AVIV UNIV. (ISRAEL). DEPT. OF BOTANY.
LOCALIZATION OF IONS IN THE MESOPHYLL CELLS OF THE SUCCULENT HALOPHYTE SUAEDA MONOICA FORSSK. BY X-RAY MICROANALYSIS,
W71-07820 02I

THE EFFECT OF WATER POTENTIAL ON THE CARBON DIOXIDE COMPENSATION POINT OF MAIZE AND SUNFLOWER LEAF TISSUE,
W71-07826 02I

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF CIVIL ENGINEERING.
SEDIMENT TRANSPORT IN FLOW DISTURBED BY RAINFALL,
W71-08060 02J

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF WILDLIFE SCIENCE.
BENEFICIAL USES OF WARM WATER DISCHARGES IN SURFACE WATERS,
W71-08304 03C

TEXAS TECHNOLOGICAL COLL., LUBBOCK.
HIGH PLAINS IRRIGATION AND TEXAS WATER PLAN,
W71-07740 06D

TEXAS TECH. UNIV., LUBBOCK. DEPT. OF CIVIL ENGINEERING AND TEXAS TECH. UNIV., LUBBOCK. DEPT. OF CHEMISTRY.
CONCENTRATIONS OF POLLUTANTS IN AGRICULTURAL RUNOFF,
W71-08053 05B

TOHOKU UNIV. SENDAI (JAPAN). DEPT. OF FISHERIES AND MIYAGI TECHNICAL COLL. (JAPAN). DEPT. OF METAL ENGINEERING.
STUDIES ON THE POST-MORTEM IDENTIFICATION OF THE POLLUTANT IN FISH KILLED BY WATER POLLUTION--XII. ACUTE POISONING WITH MERCURY (1), (IN JAPANESE),
W71-08038 05C

TOKYO UNIV. (JAPAN). LAB. OF MARINE BIOCHEMISTRY.
GLENODININE, AN ICHTHYOTOXIC SUBSTANCE PRODUCED BY A DINOFLAGELLATE, PERIDINIUM POLONICUM,
W71-07731 05C

TORONTO UNIV. (ONTARIO). DEPT. OF CIVIL ENGINEERING.
A PERFORMANCE ANALYSIS OF AN ACTIVATED SLUDGE TREATMENT PLANT,
W71-07763 05D

TRECAN LTD., COOKSVILLE (ONTARIO).
INCINERATION OF PROCESS INDUSTRY WASTES,
W71-08016 05G

TRENT UNIV., PETERBOROUGH (ONTARIO).
NUTRIENT SUPPLY AND PRIMARY PRODUCTION IN CLEAR LAKE, EASTERN ONTARIO,
W71-07890 05B

UNION COUNTY PLANNING BOARD, N.J.
STORM DRAINAGE FACILITIES, UNION COUNTY, NEW JERSEY.
W71-07868 05G

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 16
AUGUST 15, 1971

THE LIBRARY OF THE
OCT 7 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W71-08322 -- W71-08941

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 16
AUGUST 15, 1971

W71-08322 -- W71-08941

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

NUMERICAL SIMULATION OF WATERSHED HYDROLOGY,
Texas Univ., Austin. Dept. of Civil Engineering.
W. J. Claborn, and Walter L. Moore.
Available from the National Technical Information Service as PB-199 644, $3.00 in paper copy, $0.95 microfiche. Hydraulic Engineering Laboratory Technical Report HYD 14-7001, Aug 1970, 225 p, 9 fig, 4 ref, 2 append. OWRR Project B-015-TEX (3).

Descriptors: *Water-beds (Basins), *Model studies, *Demonstration watersheds, Computer models, Mathematical models, *Synthetic hydrology, *Simulation analysis, Dynamic programming, Numerical analysis.
Identifiers: Stanford waterbed model, *Watershed models.

This research developed methods for a numerical simulation of watersheds which will be both operational from the standpoint of engineering usage and realistic from the standpoint of simulating physical processes occurring in the watershed. The Stanford Watershed Model has been reviewed and used as a pattern for developing a new watershed simulation model. The new model incorporates considerable flexibility of input data and model time steps which were not available in the Standford Model. In making a detailed translation of the model into Fortran IV compiler language, a nearly complete understanding of the model was achieved and has been presented as a part of the report. New parameters describing the infiltration, evaporation, and soil water movement processes have been defined and related to physical properties of the watershed where possible. Application to two experimental watersheds are reported.

AN EXPERIMENT IN DETERMINISTIC WATERSHED MODELING,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
Darrel E. Dunn.
Water Resources Bulletin, Vol 7, No 2, p 343-347, Apr 1971. 5 p, 1 fig, 6 ref. OWRR Project A-025-MONT (2).

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Simulation analysis, Routing, Numerical analysis, Computer programs.
Identifiers: Deterministic models, Finite difference method.

An experimental three-dimensional watershed model in the form of a Fortran IV program was constructed. The model was an oversimplified one which divided the watershed volume into layers of cells which represented the overland flow, the vadose, and the phreatic zones. Water budget equations which utilized such formulas as Darcy's law and Manning's equation were applied to each interior cell. The resulting set of simultaneous equations was solved for heads at the end of successive time increments. This information was transformed to streamflow and other hydrologic output. Input was weather data, which effected appropriate adjustments in the cells representing the surface-water and vadose zones. After testing the model, it was concluded that this type of model is indesirably sensitive to cell size and length of time increment. In spite of the deficiencies of this primitive model, this general kind of approach to modeling seems promising, but it may be necessary to devise new transport equations which apply to more natural divisions of watersheds. OBSERVATIONS OF THE EFFECT OF EXTREME HIGH WATER IN 1965 AND 1966 ON THE GROUNDWATER BODY OF THE LIENZ BASIN-EAST TIROL (GERMAN: BEOBACHTUNGEN UBER DIE AUSWIRKUNG DER EXTREMEN HOCHWASSER 1965 UND 1966 AUF DEN GRUNDWASSERKORPER IM BECKEN VON LIENZ (OSTTIROL),
G. Platzer.
English abstract. Steirische Beitrage zur Hydrogeologie, No 20, Graz, p 81-98, 1968. 18 p, 6 fig, 2 tab, 7 ref.

Descriptors: *Surface-groundwater relationships, *Floods, *Groundwater recharge, *Water levels, Rainfall-runoff relationships, Water level fluctuations, Groundwater basins, Water storage, Water temperature, Water chemistry.
Identifiers: *Lienz (Austria), *Austria.

The groundwater body of Lienz and the surrounding districts extends on both sides of the river Drau from the mouth of the Pustertal at Leisach to the border between the provinces of Carinthia and Tirol, Austria. The basin is bordered by steep mountains, over 2000 m high, consisting of crystalline schists and mexozoic rocks, and it is connected with other groundwater bodies only at three narrow points of the Drau and Isel valleys. The reservoir covers an area of 35 sq km, is approximately 16 km long and up to 4 km wide, and is situated in quarternary deposits of unknown thickness. The reservoir has one underground outlet in the western part, and an underground and surface outlet of approximately the same size in the eastern part. The groundwater discharge is min. 3 cu m/sec. Average rainfall is 900 to 2000 mm per annum. The three floods of September 1965, August and November 1966 with a measured rainfall of 144--259 mm had a great effect on the groundwater body. The groundwater tables rose up to 4.80 m. The flow direction changed up to 90%. A raise of groundwater temperature of 0.9 to 2 deg. C. was also recorded in some wells after the floods. Even more significant was the change of the chemical characteristics of the groundwater. The pH-value, the electrolytic conductivity, the total hardness, the carbonate and noncarbonate hardness increased considerably. (Knapp-USGS)

EFFECTS OF AREAL AND TIME DISTRIBUTION OF RAINFALL ON SMALL WATERSHED RUNOFF HYDROGRAPHS,
Minnesota Univ., Minneapolis. Dept. of Agricultural Engineering.
T. C. Wei, and C. L. Larson.
Available from the National Technical Information Service as PB-199 837, $3.00 in paper copy, $0.95 in microfiche. Minnesota Water Resources Research Center, Bulletin 30, 1971. 118 p, 31 fig, 28 tab, 71 ref. OWRR Project A-017-MINN (2).

Descriptors: *Rainfall-runoff relationships, *Mathematical model, *Peak discharges, Watershed, Minnesota, Climate, Precipitation, Hydrographs, Storm runoff, Routing, Computer, Overland flow, Channels, Geology, Soil types, Topography.
Identifiers: *Watershed model, *Rainfall excess, *Storm movement, Lag time, Time distribution, Areal distribution.

A mathematical watershed model of 1.456 square miles was developed to route runoff through overland flow and through the channel system. Excess rainfall was used as input data and the flow was routed by the successive numerical solution of the kinematic wave equations to produce outflow hydrographs for elementary (first order) watersheds. These hydrographs were used as input to the channel system where the flow was routed by the successive numerical solution of the dynamic wave equations to yield the outflow hydrograph for the model watershed. Backwater effects were considered at most of the junctions of the model watershed. The model was used to study the effects of time distribution and areal distribution of rainfall, storm movement and watershed shape on the runoff hydrograph. In each study, attempts were made to find a relationship between an appropriate input parameter and a modification (peak flow) coefficient, to be used in adjusting the peak discharge estimated by conventional methods, which normally assume a stationary, constant intensity storm uniformly distributed over the watershed. The results of this study indicate that, in general, the selected factors have significant effects on peak discharge. (Walton-Minnesota)

CALCULATED AND OBSERVED CHANGES IN SEA SURFACE TEMPERATURE ASSOCIATED WITH HURRICAN PASSAGE,
Naval Postgraduate School, Monterey, Calif. Dept. of Oceanography.

Jack James Jenson.
Available from the National Technical Information Service as AD-713 052, $3.00 in paper copy, $0.95 in microfiche. MS Thesis, Naval Postgraduate School, Sept 1970. 55 p, 16 fig, 1 tab, 16 ref.

Descriptors: *Water temperature, *Gulf of Mexico, *Hurricanes, Surface waters, Meterological data, Model studies, Computer models, Hydrologic data, Forecasting, Heat transfer, Advection, Convection, Thermal stratification, Oceanography, Data collections.
Identifiers: Ocean-temperature changes (Hurricanes).

Analyses were made of the sea surface temperatures in the Gulf of Mexico for the month of August for the four years 1965 through 1968. No one pattern was found to predominate. The subsurface profiles were then considered, and a rate of simulated withdrawal of 4000 calories of heat per day was made, until the temperature did not exceed 26 deg C. This withdrawal represented heat removed during passage of a hurricane. Difference analyses were constructed for the initial sea surface temperature at each station after twenty-four hours of simulated withdrawal. The differences ranged from less than one degree to over four degrees. Again, no consistent pattern was found but generally areas of high concentrations of heat experienced smaller decreases. Actual sea surface temperatures collected after two hurricanes were then analyzed and compared to temperature pattern predicted by the computer model. Illustrations of the relative availability of sensible heat energy for different sea surface temperatures are presented and a hypothesis made to account for the greater than average intensities of Hurricanes Betsy (1965) and Camille (1969). (Woodard-USGS)

CLOUD DEVELOPMENT AND DISTRIBUTION AROUND KHARTOUM,
Southern Oregon Coll., Ashland. Dept. of Geography.
R. M. Hammer.
Weather, Vol 25, No 9, p 411-414, Sept 1970. 3 fig, 2 ref.

Descriptors: *Clouds, *Rainfall, *Semiarid climates, *Climatic data, *Surface waters, Topography, Vegetation effects, Orography, Radar, Onsite investigations, Evaporation, Edge effect, Environmental effects, Winds, Mode of action.
Identifiers: *Cumulus clouds, *Cumulonimbus clouds, *Sudan, *Cloud distribution.

Mesoscale distributions of cumuliform clouds were mapped in the Khartoum region of the Sudan, and an attempt was made to evaluate cloud distribution in terms of surface features. Visual observations during the rainy seasons (1964-1965) indicated that about 95% of the first cumulus were concentrated in 2 major areas, one to the east and southeast around Khartoum, and the other west of Khartoum. Using radar and visual observation, areal distribution and development of showers was mapped. About 80% developed in the southeast quadrat and 15% slightly west. For various reasons, orographic effects, vegetation, and soil color were ruled out as primary causes of cloud development, while the distribution of water and irrigated surfaces presented a fairly close relationship to the cloud pattern. A possible causative mechanism might be the development of a cool moist dome over the water which in turn might cause an increased convergence of the surface wind along the west side of the dome, resulting in greater low-level cloud development. Perhaps man, through irrigation, has inadvertently enhanced shower development in the region. (Casey-Arizona)
W71-08449

SPACE-TIME VALIDATION OF A THUNDERSTORM RAINFALL MODEL,
Arizona Univ., Tucson. Dept. of Watershed Management.
M. M. Fogel, L. Duckstein, and C. C. Kisiel.
Water Resources Bulletin, Vol 7, No 2, p 309-316, Apr 1971. 8 p, 3 fig, 2 tab, 9 ref. OWRR Project A-020 ARIZ (2).

Descriptors: *Probability, *Statistical models, *Rainfall, *Thunderstorms, *Illinois, Precipitation (Atmospheric), Frequency analysis, Distribution patterns, Urbanization, Cities, Rainfall-runoff relationships.
Identifiers: *Urban water resources, *Urban hydrology, Chicago (Illinois).

A probability model for predicting the occurrence and magnitude of thunderstorm rainfall developed in the southwestern United States was tested in the metropolitan Chicago area with reasonable success, especially for the moderate to the extreme runoff-producing events. The model requires the estimation of two paramenters, the mean number of events per year and the conditional probability of rain given that an event has occurred. To tie in the data from more than one gage in an area, an event can be defined in several ways, such as the areal mean rainfall exceeding 0.50 inch and at least one gage receiving more than 1.0 inch. This type of definition allows both of the model parameters to be obtained from daily warm-season rainfall records. Regardless of the definition used a Poisson distribution adequately described the number of events per season. A negative binomial distribution was derived as representing the frequency density function for rainfall where several gages are employed in defining a storm. Chicago data fit both distributions very well at events with relatively high return periods. The results indicate the possibility of using the model on a regional basis where limited amount of data may be used to estimate parameters for extensive areas. (Knapp-USGS)
W71-08530

HEAVY RAIN, HAIL, AND TORNADOES ON 15 MAY 1968,
Illinois State Water Survey, Urbana.
Stanley A. Changnon, and John W. Wilson.
Illinois Water Survey Report of Investigation 66, 1971. 48 p, 42 fig, 13 tab, 26 ref.

Descriptors: *Thunderstorms, *Illinois, *Synoptic analysis, *Tornadoes, *Cloudbursts, Cyclones, Disasters, Storm runoff, Turbulence, Storm structure, Flooding, Squalls, Weather patterns, Cloud physics, Lightning, Overland flow, Precipitation (Atmospheric), Anticyclones, Atmospheric pressure, Climatic data, Fronts (Atmospheric), Rainfall intensity, Wind velocity, Distribution patterns, Soil erosion.
Identifiers: *McLean County, *Dewitt County, *Platt County, Bloomington, Farmer City (Ill).

On 15 May 1968 a severe storm combining heavy rain, tornadoes, and extensive hail occurred and maximized over a 1765-square-mile dense raingage-hailpad and hail observer network in central Illinois. In a 14-hour period the network area had 4 major rain systems which included 19 thunderstorms (rain cells) and point rainfalls exceeding 10 inches, 113 hailstreaks with hail over 1664 square miles, and 6 tornadoes. Crop and property damages were extensive. One rain system was a gigantic steady-state storm that produced excessive rain rates, the tornadoes, and a design hailstreak which lasted 90 minutes with point durations up to 45 minutes, covered 788 square miles, and produced 2-inch hailstones. Rainfall rates for durations ranging from 15 minutes up to 6 hours easily exceeded 100-year point frequency values, and at its peak, the steady-state storm released 883 million cubic feet of water in one 15-minute period. Many synoptic weather conditions conducive to severe weather outbreaks existed in central Illinois on 15 May. All four rain systems maximized their rain, hail, and tornado production within a 1765-square-mile area. The conditions critical for severe weather formation had not altered their geographical position over a 6-hour period, a situation frequently necessary for the production of 10-inch or greater rainfalls in Illinois. METHODS OF CALCULATING SNOW COVER DENSITY IN THE KYZYLCHA MOUNTAIN RIVER BASIN (RUSSIAN: NEKOTORYYE SPOSOBY RASCHETOV PLOTNOSTI SNEZHNOGO POKROVA V BASSEYNE GORNOY REKI KYZYLCHA),
Yu. B. Sadvakasov, and Ye. M. Kozik.
Meteorologiya i Gidrologiya, No 11, p 77-82, Nov 1970. 1 fig, 5 tab, 3 ref.

Descriptors: *Snow cover, *Snow surveys, *River basins, Precipitation (Atmospheric), Air temperature, Meteorological data, Foreign research.
Identifiers: *USSR, Tyan'-Shan' Mountains.

Snow survey data for a six-year period (1960-1965) are used for finding methods to calculate snow cover density. Density of the snow cover is examined as a function of time and as a function of the amount of winter precipitation and air temperature. A comparison of the two methods shows that in 85 and 90% of the cases, respectively, absolute errors do not exceed 0.04 g/cu cm and that root mean-square errors are 0.031 g/cu cm. Additional studies are required to increase the accuracy of computations by accounting for the effect of meteorological factors. (Josefson-USGS)

EXPERIENCE WITH THE USE OF TURBO-DRILL INSTALLATIONS IN HYDRAULIC CONSTRUCTION,
G. F. Biyanov, and L. N. Toropov.
Hydrotechnical Construction, No 3, p 217-220, Mar 1970. 4 p, 4 fig, 2 ref.

Descriptors: *Cold weather construction, Arctic, *Thawing, Snow, *Snow removal, Foreign construction, Frozen soils, Construction, Cutoffs, Ice, Foundations, Concrete placing, Soil compaction, Mobile equipment, Cutoff trenches, Rockfill dams, Permafrost, Safety, Foreign design practices.
Identifiers: *Turbojet engines, Viliuisk Dam and Yerpit (USSR), USSR, *Ice removal.

High temperature exhaust gases from turbojet engines were used in the USSR for thawing and drying frozen soils during construction at the Viliuisk hydroelectric installation. Turbojet equipment was installed on the left bank of the river near the trench and dam cutoff for thawing 20,000 cu m of frozen loam to be placed in the cutoff and core of the dam. In addition to stationary installations, turbojet engines were mounted on caterpillar or wheeled chassis for removing snow and ice from fills or used in stripping rock foundations in preparation for concrete placement. The experiences encountered at the Viliuisk installation demonstrated that the turbojet equipment can be used successfully for different construction operations on hydraulic construction work in Arctic regions. PHYSICAL PROPERTIES OF ALPINE SNOW AS RELATED TO WEATHER AND AVALANCHE CONDITIONS,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
E. Martinelli, Jr.
USDA Forest Serv. Res. Pap RM-64, 35 p, illus.

Descriptors: *Avalanches, *Snowpacks, *Snow, Snow cover, Crystals, Climatic data, Weather data, Colorado, Bulk density, Porosity.
Identifiers: *Alpine, *Slab avalanches, Physical properties, Snow crystals, Avalanche starting zones.

Data were taken in avalanche starting zones at 11,700 feet in Front Range of Colorado within 14 days of deposition. Densities varied from 40 to 450 kg m-3. A statistical criterion was used to identify snow with unusually high density for its age (initial hard slab) and unusually low (persistent soft snow). Initial hard slab, found in 15 percent of the pits, was correlated with moderate to high windspeeds, low temperatures, and blowing snow. No way was found to distinguish initial hard slab from dense older snow. Tensile strength varied from 1.0 to 712 grams force cm-2. Strength increased with density but varied greatly. Younger snows were weaker than older snows of same density. Strength was also measured with shear box and shear vane. Ram resistance was higher for alpine snow than for snow of same density in trees. Air permeability was 1 order of magnitude less than expected and varied with low flow rate used. The ratio virtual porosity/porosity, which averaged 1.062, was of little value for identifying wind slab. Strength of snow of given density was greater for a certain permeability (texture) than for any other.

BIBLIOGRAPHY ON NORTHERN SEA ICE AND RELATED SUBJECTS,
Canada Ministry of Transport, Ottawa (Ontario). Marine Operations; and Department of Energy, Mines and Resources, Ottawa (Ontario). Marine Sciences Branch.
J. D. Bradford, and S. M. Smirle.
Canada Ministry of Transport and Dept of Energy, Mines and Resources Cooperative Bibliographic Report, Jan 1970. 188 p.

Descriptors: *Bibliographies, *Publications, *Information retrieval, *Sea ice, *Navigation, Icebergs, Oceans, Documentation, Ships, Libraries.
Identifiers: *Northern sea ice.

This bibliography contains the references cited to subjects which have a bearing on the operation of ships in ice. While geographically the emphasis is Canadian, works which describe foreign experience in northern sea ice research and technology are included. References to literature on ice islands, ice shelves and icebergs are only included if information on sea ice movement is provided. Initially, the references were gathered from recent sea ice literature. To these were added the relevant holdings of the following libraries: Department of Transport; National Science Surveys and Mapping Branch, Department of Energy, Mines and Resources; Water Sector, Department of Energy, Mines and Resources; Defence Research Board (Geophysics); Arctic Institute of North America; Stefansson Collection, Dartmouth College, U.S. Army, Cold Regions Research and Engineering Laboratory; and Massachusetts Institute of Technology. (Woodard-USGS)

2D. Evaporation and Transpiration

THE EFFECTS OF ANTITRANSPIRANT CHEMICALS ON THE TRANSPIRATION AND PHYSIOLOGY OF TAMARIX SPECIES,
Arizona Univ., Tucson. Dept. of Watershed Management.
Kenneth Norman Brooks.
Arizona University, PhD Dissertation, 1970. 84 p, 17 fig, 20 tab, 75 ref. OWRR Project A-018-ALA (1).

Descriptors: *Phreatophytes, *Tamarisk, *Stomata, *Water conservation, *Chemcontrol, Laboratory tests, Environmental effects, Plant physiology, Mode of action, Transpiration, Leaves, Photosynthesis, Respiration, Arid lands, Plant growth, Temperature, Foliar application.
Identifiers: *Antitranspirants, *Leak temperatures.

In the water-short southwest, certain phreatophyte species have been highly controversial. Because these plants exploit the water table and have high transpiration rates, expensive eradication programs have often been employed. However these have been opposed for esthetic and wildlife conservation reasons. If suitable antitranspirants were developed, perhaps water use could be decreased without plant destruction. Using tamarisk (Tamarix pentandra Pall.) and athel tree (T. aphylla L.), several antitranspirants were subjected to greenhouse study and the potentially effective compounds given further detailed study. Spray applications of 0.01 M 8-hydroxyquinoline sulfate and a combination of 150 ppm mono-methyl and 150 ppm mono-glyceryl esters of N-decenylsuccinic acid in Triton X-100 solutions reduced daily transpiration rates 28-36% for 20 days. Both applications reduced tamarisk stomatal apertures significantly, and reduced growth rates for 10-20 days. The decreased growth rates may have caused the reduced transpiration rates. Foliage analyses showed no effect on chlorophyll and protein contents. Transpiration rates of potted field tamarisks were reduced for only 5 days, but this may have been affected by rainfall on the fifth day. The data indicates that tamarisk transpiration may be substantially reduced by antitranspirants through growth reduction without lethal increases in foliage temperature. (Casey-Arizona)

THE ENERGY BUDGET OF MAN AT HIGH ALTITUDES,
California Univ., Los Angeles. Dept. of Geography.
W. H. Terjung.
International Journal of Biometeorology, Vol 14, No 1, p 13-43, 1970. 30 fig, 19 ref.

Descriptors: *Arid lands, *Mountains, *Solar radiation, *Energy budget, *Model studies, Environmental effects, On-site investigations, Climatic data, Altitude, Estimating equations, Seasonal, Diurnal, Air temperature, Albedo, Air masses, Snow cover, Climatic zones, California, Evaporation, Correlation analysis, Convection.
Identifiers: *Radiation climatology, *Optical airmass, *Sweating.

The greatest solar radiation intensities on this planet may occur during the summer in arid region high mountain ranges of the lower middle latitudes, such as the White Mountain Range of California. Attempts were made to link the physical energy balance climatology of the area to the human energy balance climatology along an altitudinal transect. Energy balance equations relating radiation to evaporation, sensible heat flux and soil heat flux are developed for physical-horizontal surfaces and human surfaces. The direct beam solar radiation on a horizontal surface could be roughly described by an exponential function of elevation that varied with time while the radiative lapse was an approximate negative exponential function of the sun zenith angle. A plot of the ratio of direct beam (or diffuse) solar radiation to available energy on top of the atmosphere vs. optical airmass showed a good-fitting linear relationship, creating a highly predictive method for deducing the midsummer radiation climatology of the area. Air temperature proved a poor measure of the conditions affecting man. The human net radiation pattern was inverse to the diurnal radiation pattern for the horizontal-physical surface. The data was used to test 2 variations of a model predicting human net radiation at high elevations: a summer model and a simulation model for the whole year. The predictive abilities for both models were high and their construction yielded several insights. Vertical man probably receives more than half of the reflected diffuse solar radiation and the relatively high amounts of human net radiation could be drastically reduced by stepping under a tree. At the peak of human net radiation, evaporation (sweating) was activated to share the burden of heat disposal with the sensible heat fluxes. (Casey-Arizona)

A NIGHTTIME ENERGY AND MOISTURE BUDGET IN DEATH VALLEY, CALIFORNIA, IN MID-AUGUST,
California Univ., Los Angeles. Dept. of Geography.
Werner H. Terjung, Simon O. Ojo, and Stanley W. Swarts.
Geografiska Annaler, Vol 52A, No 3-4, p 160-173, 1970. 17 fig, 1 tab, 26 ref.

Descriptors: *Deserts, *Energy budget, *Solar radiation, *Evaporation, *Climatic data, Environmental effects, Advection, Ecosystems, Air temperature, Soil temperature, Albedo, Dew, Convection, Conduction, Infrared radiation, Wind velocity, Model studies, Estimating equations, On-site investigations, Vapor pressure, Diurnal distribution.
Identifiers: *Mojave Desert, *Death Valley, *Moisture budget, *Net radiation, *Bowen ratio, Radiation efficiency.

Basic observational data on the diurnal regime of radiation budgets and their observed phenomena were obtained over 20 hr. of a hazy August day in Death Valley. The basic energy budget equations are developed, their physical components described, and measurement techniques reviewed. Total environmental radiant temperature (Tsube) is more important in determining organism heat gain or loss than the popularly used air temperature. Tsube is one-half the sum of bare soil and sky temperatures. Desert vegetation surface temperatures, compared with bare surface temperatures, were lower during the day and higher at night. Soil temperatures were considerably higher during the night than actual surface temperature. During the night, steady infrared radiation loss resulted in a negative net radiation ratio (-0.13 ly/min) and the resulting energy budget deficit was satisfied by heat flux out of the ground. Little nighttime evaporation occurred except when high wind speeds created advective effects interrupting dew deposition. A theoretical net radiation model developed by Sellers and Budyko was tested against the observed data and excellent agreement was found. Parts of the model were expanded and again agreed well with observations. Net radiation and other energy budget data could therefore have been obtained from meteorological data commonly available at major weather stations. (Casey-Arizona)

SOME PHYSICAL ASPECTS OF WATER RESOURCE DEVELOPMENT IN TANZANIA,
University Coll., Dar-es-Salaam (Tanzania). Dept. of Geography.
Ian J. Jackson.
Geografiska Annaler, Vol 52A, No 3-4, p 174-185, 1970. 5 fig, 10 tab, 40 ref.

Descriptors: *Rainfall, *Evapotranspiration, *Climatic data, *Water resources development, *Water requirements, Crops, Research and development, Hydrological cycle, Rainfall disposition, Data collections, Land use, Variability, Semiarid climates, Stemflow, Sediment yield, Streamflow, Forests, Runoff, Vegetation.
Identifiers: *East Africa, *Tanzania, *Potential evapotranspiration.

Tanzania is mainly an agricultural country with limited water resources and seasonal rainfalls. Climatic zones range from the coastal humid areas to large semiarid regions. The relief and annual regional rainfalls of the country are described. Rainfall variability has a drastic effect on agriculture and only half the country has a threshold 750 mm rainfall per year with 80% probability. The Penman method of determining potential evapotranspiration has proved to be the most accurate. Despite uncertainties it appears that evaporation rates are high in relation to rainfall. Spatial and temporal variations of rainfall are analyzed. Particularly important are the evaporative demand/crop water requirement ratios in differing regions for differing crops. A number of experiments in catchment areas on land use impact have yielded important results. Dense forests are excellent catchment areas, and the replacement of bamboo by softwood does not produce permanent effects on runoff or sediment yield, while replacement of high forests by tea plantations may increase runoff by 15%. Soil erosion becomes a serious problem in cultivated catchments and must be balanced against water loss by tree transpiration. An overgrazed region with more than 750 mm/yr rainfall may have vegetation characteristic of arid regions. Much data is urgently needed and promising research projects are outlined. (Casey-Arizona)

RESEARCH RELATES WEATHER TO NEBRASKA WATER USE,
Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
Norman J. Rosenberg.
Nebraska Farm, Ranch and Home Quarterly, Vol 16, No 2, Summer 1969, p 25-28. 2 tab, 3 fig.

Descriptors: *Transpiration, *Evapotranspiration, *Lysimeters, *Instrumentation, *Soil-water-plant relationships, Weather, Nebraska, Evaporation, Great Plains, Water vapor, Water transfer, Energy budget, Sprinkler irrigation, Flood irrigation, Meteorology, Experimental farms, Solar radiation, Soil temperature, Wind velocity, Humidity, Elevation, Soil properties, Water demand, Consumptive use, Atmospheric physics, Alfalfa, Crop production, Windbreaks, Evaporation control.
Identifiers: Net radiation, Soil heat flux, Data loggers.

Research is described which relates weather conditions to evaporation and plant water use in the Great Plains of eastern Nebraska. Basic principles of evaporation, evapotranspiration, lysimeters, water vapor transfer, and energy budgets are discussed. Energy budgets for eastern and western states are contrasted according to evapotranspiration regimes. Precision weighing lysimeters were installed on a sprinkler and flood-irrigated 5-acre plot at the University of Nebraska Field Laboratory at Mead in 1966. Water evaporated in a 15-minute period can be accurately measured. Meteorological instruments at the site measure solar and net radiation, soil heat flux, wind speed and direction, temperature and humidity at various elevations, and soil and plant temperatures. Instrumentation is linked together by data loggers, which are computer compatible. Quality checking and analysis generates important data on radiation balance and heat transport. A computer plotter graphs functional relationships between measured parameters. The water demand of consumptive crops and atmospheric processes are studied. Evapotranspiration is highest in the late spring and early summer because of hot winds. Evaporation is highest in the daytime, and continues at night as soils release energy. These studies will be useful for optimum water use on alfalfa and other crops. Other experiments on water use efficiency, anti-transpirant chemicals, reflectant materials, and windbreaks will be conducted. Figures and tables show a precision lysimeter, meteorological sensors, data loggers, and energy balance and nocturnal evapotranspiration data sheet. (Popkin-Arizona)

MEASURING ILLUMINATION WITHIN SNOW COVER WITH CADMIUM SULFIDE PHOTO RESISTORS,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
James D. Bergen.
USDA Forest Serv Res Note RM-181. 4 p.

Descriptors: *Snow, *Solar radiation, *Snowpacks, *Photometry, Colorado, Snow cover, Light intensity, Solar radiation.
Identifiers: *Photo resistors, *Cadmium sulfide, Light attenuation, Turbidimetry.

Light-sensitive cadmium sulfide resistors can measure the downward flux of sunlight in the snow cover. When the variation of sensor response and the absorptivity of ice are considered together with the approximate distribution of energy in the solar spectrum, the variation of cell resistance (R) is estimated by 4.55/RE.925 — 2.1 X.925 .. X3.27 where (E is the total incident radiation at the snow surface and (X) is the average attenuation ratio for radiation between 0.5 microns and 0.7 microns. The last term becomes negligible for values of XA0.3.

ESTIMATING EVAPOTRANSPIRATION - AN EVALUATION OF TECHNIQUES.
Australian Water Resources Council, Canberra.

Australian Water Resources Council Hydrological Series No 5, 1970. 23 p, 49 ref.

Descriptors: *Evaporation, *Energy budget, *Evapotranspiration, *Analytical techniques, Estimating, Evaluation, Data collections, Lysimeters, Equations, Instrumentation, Costs, Water balance, Advection.
Identifiers: *Australia.

Several Australian techniques for measuring evaporation from natural surfaces are described. The three main techniques involve determination of (1) the evaporation term in the water balance, (2) the latent heat term in the energy balance, and (3) the net upward flow of water vapor in the air layers near the gound. In addition, methods developed involving combinations of (2) and (3) and a number of procedures developed for empirically calculating E from measured meteorological variables are discussed. At present the method suitable for the measurement of evaporation, from most types of land surfaces, appears to be that based on the evaluation of the surface energy balance. (Woodard-USGS)

Descriptors: *Mathematical models, *Streamflow, *River basins, *Input-output analysis, Least squares method, Foreign research, Melt water, Rain water, Discharge (Water), Aquifers, Runoff.
Identifiers: *USSR, Akhangaran River, Mountain basins.

A river basin is viewed as a dynamic system whose input is the flow of snowmelt and rain water onto a basin surface and whose output is the discharge of water at the outlet. In view of differences in the conditions and character of water movement on surfaces and in variously located aquifer horizons, a mountain basin is presented in the form of several reservoirs (layers) located one under the other and connected in series-parallel mode. It is assumed that water moves out of reservoirs into underlying reservoirs as well as from each reservoir into the outlet. Two methods are used to find optimal parameter values for mathematical models of streamflow transformation by a mountain basin--the least squares method and a combination method involving a one-volume nonlinear and a two-volume linear model. The combination method is preferred in determining model parameters for the Akhangaran River for the period 1957-1963. (Josefson-USGS)

Descriptors: *Runoff forecasting, *Snowmelt, *Rainfall-runoff relationships, *Discharge (Water), Melt water, Air temperature, Seasonal, Precipitation (Atmospheric), Climatic data, Tributaries, River forecasting, Surface-groundwater relationships.
Identifiers: *Ukraine, Dniester River, Snow storage, Spring runoff.

An analysis was made of the formation conditions of spring runoff in the Dniester basin for determining the possibility of preparing forecasts. The spring runoff used was that formed mainly by the melting of snow after air temperature had finally risen above the 0 deg C mark. Spring runoff from the Dniester River was separated into its component parts according to recharge. The meltwater component in the total Dniester spring runoff was 54% and the groundwater and rain component 22 and 24%, respectively. A major role in the formation of Dniester spring runoff was assumed by Carpathian river tributaries, with little participation by the left bank of the basin, which covered 66% of the basin area. A relationship was established between Dniester spring runoff and snow storage by time of snowmelt and precipitation during the high-water period. The computed value of snow storage and precipitation in the basin was determined by their participation in total spring runoff. It was also established that fall wetting in the Dniester basin had no appreciable effect on the magnitude of spring runoff. Use of the relationship obtained was complicated by the impossibility of arriving at an accurate estimate of the precipitation which would occur during a runoff formation period. It is suggested that a forecast of maximum spring inflow for the Dniester be prepared and then refined on the basis of the actual amount of precipitation after start of spring runoff. FLOODS OF SEPTEMBER 1970 IN ARIZONA, UTAH, AND COLORADO,
Geological Survey, Phoenix, Ariz.
R. H. Roeske.
Arizona Land Department Water Resources Report, No 44, Apr 1971. 20 p, 1 tab.

Descriptors: *Floods, *Flood damage, *Arizona, *Utah, *Colorado, Rainfall, Runoff, Streamflow, Stream gages, Hydrologic data, Data collections, Flow rates, Discharge measurement, Peak discharge, Flood plains, Meteorological data.
Identifiers: *Arizona floods (1970).

Record floods occurred in Arizona, southeastern Utah, and southwestern Colorado on September 4-7, 1970. The floods took the lives of 25 persons and caused millions of dollars in property damage. The heaviest rainfall occurred in the mountainous areas of central Arizona. Numerous precipitation stations recorded 5 to 8 inches of rainfall in 24 hours, and one station recorded 11.40 inches, which is an alltime record for 24-hour precipitation in Arizona. Two separate peaks of nearly equal stage occurred at Tonto Creek above Gun Creek near Roosevelt. The discharge at the higher stage was 53,000 cfs, which is the highest discharge recorded since the station was established in 1940. The records from two old staff gages at downstream sites indicate this might be the highest peak since the early 1900's. All flow from Tonto Creek was stored in the Salt River reservoirs. A similar storm, but of lesser magnitude, struck southeastern Utah and southwestern Colorado September 12-14, 1970. The largest total 3-day precipitation reported for this storm was 4.83 inches, and the largest 24-hour total reported was 2.84 inches. (Woodard-USGS)

Identifiers: *U.S. Geological Survey, *Water resources research.

'Geological Survey Research 1970,' the eleventh annual review of the economic and scientific work of the U.S. Geological Survey, consists of four chapters (A through D) of Professional Paper 700. Chapter A summarizes significant results, and the remaining chapters consist of collections of short technical papers. The purpose of the volume is to make available promptly to the public many of the highlights of Survey research and investigations. USGS reports are listed in 'Publications in Fiscal Year 1970'. If a summary statement is the result of collaboration with a colleague from outside the Survey, the colleague's current organization (such as a university) is indicated in parentheses immediately following his name in the text. HYDROLOGIC DATA UTILIZATION IN FORECASTING THE SPRING 1969 MIDWEST SNOWMELT FLOODS,
Environmental Science Services Administration, Kansas City, Mo., Weather Bureau River Forecast Center.
Herman F. Mondschein.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 468-481, 1970. 14 p, 5 fig, 2 tab, 11 ref.

Descriptors: *Flood forecasting, *Snowmelt, *Rainfall-runoff relationships, *Data processing, *Warning systems, Mississippi River Basin, Digital computers, Monitoring, Snowpacks, Flood damage, Runoff, Floods.
Identifiers: *Midwestern U.S.

The causes of the 1969 upper Midwest spring floods began in October 1968, when rainfall two and three times normal soaked several states in the area. In mid-December snows occurred at frequent intervals and before Christmas more than 2 feet was reported at several locations from Kansas to Minnesota. Succeeding months brought additional snow and freezing rain, further increasing the amount of stored water in the snowpack. In spring, snowmelt was rapid, and flooding was severe, widespread, disastrous and of record breaking proportions in a number of widely separated localities from southern Nebraska to westcentral Minnesota. This paper describes the treatment of hydrologic and meteorologic data in the preparation of river stage and flood forecasts by the Kansas City River Forecast Center of ESSA Weather Bureau, both prior to and during this flood. The application of digital computer technology to this problem is emphasized. (See also W71-08550) (Knapp-USGS)

Descriptors: *Turbulent flow, *Eddies, *Vortices, *Flow around objects, Hydraulics, Hydraulic structures, Piers, Hydraulic models, Hydrodynamics.
Identifiers: *Flow around cylinders.

Eddies formed in the wake of a cylinder in cross flow are explained. Potential flow theory is used to demonstrate basic tendencies resulting from the behavior of shear layers and vortices under a variety of conditions prevailing in actual flows. Eddies are shed alternately behind a cylinder and form Karman vortex streets, as a combination of vorticity emanating from the boundary layers and the instability of these layers due to their vorticity. Potential flow theory gives useful predictions of flow about bluff cylinders. Shear layers are readily disintegrated by flow disturbances. The effects of vorticity in boundary layers on other regions apparently can be approximated by the effects of disturbed finite vortices in the potential theory modelling of flow about cylinders. Descriptors: *Tides, *Water level fluctuation *Hawaii, Tidal effects, Frequency analysis, Statis cal methods, Fourier analysis.

The cospectrum of sea level at Honolulu a Mokuoloe has noticeable peaks at frequencies 0.73, 0.50, 0.35, and 0.25 c/d (cycles per da Some possible causes are discussed. The bro band near 0.73 c/d may be the local manifestati of inertial, or near-inertial currents generated winds in the vicinity of Oahu. Because of frequency and phase, the peak at 0.50 c/d is no free mode of the Pacific. Most probably represents topographic Rossby wave trapped local topography round the island. Though it m be coupled subharmonically to the tides, it is m likely generated by local wind-stresses. The pe at 0.35 and 0.23 c/d may represent the low modes of the Pacific Ocean basin. But these m tions may also be due to local weather, resonance with trapped oscillations. (Kna USGS)

MIXING IN THE SURF ZONE,
Scripps Institution of Oceanography, La Jo Calif.
D. L. Inman, R. J. Tait, and C. E. Nordstrom.
Journal of Geophysical Research, Vol 76, No 1 3493-3514, May 20, 1971. 22 p, 12 fig, 5 tab, ref.

Descriptors: *Waves (Water), *Surf, *Mix *Tracers, *Dye releases, Turbulence, Oc waves, Ocean currents, Littoral drift, Advect Turbulent flow.
Identifiers: Longshore currents.

Two important mixing mechanisms are opera within the surf zone, each having distinctive le and time scales determined by the intensity o waves and the dimensions of the surf zone. The is associated with the breaking wave and its b which produce rapid mixing in an on-offs direction. This mixing, when normalized averaged over the surf zone width, gives co cients of eddy diffusivity. The second process i vective and is associated with the longshore an current systems in the nearshore circulation For constant longshore discharge of water bet cells, this process gives a concentration down rent from a continuously injected source of dy an approximation, the concentration decrease ponentially with distance from the injection p This relation gives an apparent longshore eddy ing coefficient proportional to the longshore rent velocity.

io Water Resources Commission, Water
rces Report 2, 1970. 172 p, 56 fig, 8 map, 39
2 ref.

iptors: *Water resources development,
mflow, *Groundwater, *Water utilization,
quality, Irrigation water, Water balance,
management (Applied), Data collections,
logic data, Hydrogeology.
iers: *Ontario (Canada), Big Creek Basin
rio).

dwater and surface water resources of the
eek Basin, Ontario, were evaluated in terms
ntity, quality, occurrence and use. The vari-
drologic parameters were examined and a
ogic budget is presented. Precipitation
es about 37 inches per year and is generally
ute. During extended dry periods in the
er, irrigation is practiced to overcome
re deficiencies. Groundwater supplies are
ant in the sand deposits that cover a large
f the basin. Other supplies are also available
h in the overburden and in the upper part of
drock. Groundwater runoff was calculated to
t to about seven inches annually and main-
table base flows in the streams. The water is
lly of good quality and is used extensively for
tic and irrigation purposes. Surface-water
s are generally abundant except during the
on period. During this period extensive
awals of water seriously deplete the stream-
s much as 70 per cent on maximum days.
l runoff ranged from 6.8 to 14.7 inches dur-
below-normal precipitation period from Oc-
962 to September 1967. (Knapp-USGS)

IOINES RIVER FLOOD PLAIN INFOR-
ON DES MOINES, IOWA.
of Engineers, Rock Island, Ill.

Corps of Engineers Flood Plain Report, April
65 p, 36 fig, 23 plate, 9 tab.

ptors: *Floods, *Flood damage, *Iowa,
plains, Regional flood, Flood forecasting,
control.
iers: *Des Moines (Iowa), *Polk County
, Standard project flood, Intermediate re-
flood.

Flooding along the Des Moines River Flood Plain starting from Center Street dam in the city of Des Moines to the downstream side of the Saylorville Dam in Polk County, Iowa is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The greatest recorded flood flow on the Des Moines River within the study reach occurred on June 24, 1954. The discharge was 60,200 cubic feet per second with a peak stage of 30.16 feet at the Second Avenue gage. The corresponding discharge and stage at the County Road 'W' bridge gage were 60,000 cubic feet per second and 24.50 feet, respectively. (Woodard-USGS)

WATER RESOURCES IN THE UPPER STONES RIVER BASIN, CENTRAL TENNESSEE,
Geological Survey, Nashville, Tenn.
Charles R. Burchett, and Gerald K. Moore.
Tennessee Division Water Resources, Water Resources Series No 8, 1971. 62 p, 42 fig, 3 tab, 26 ref.

Descriptors: *Tennessee, *Hydrogeology, *Water resources development, *Water supply, *Water yield, Discharge (Water), Groundwater, Aquifer characteristics, Surface water, Domestic water, Aquifers, Fresh water, Hydrologic cycle, Subsurface waters, Water sources, Water storage, Rock properties, Connate water, Data collections, Hydrologic data, Water quality, Joints (Geology), Municipal water.
Identifiers: *Murfreesboro (Tenn), *Rutherford County (Tenn), *Nashville Basin, *Upper Stones River Basin (Tenn), Water availability, Solution cavities.

The upper Stones River basin, an area of 571 square miles in central Tennessee, is characterized by the soil cover overlying limestone formations. The formations generally are poor of water-storing (yielding) capability, resulting in low to moderate groundwater yield and highly variable streamflow. Groundwater is available in most of the basin, primarily from cracks and solution cavities in the limestone bedrock. Springs occur throughout the basin but are more numerous in the eastern part where they are located near or at the base of the steep ridges that form the Highland Rim. The minimum yield of springs within the basin ranges from less than 1 gallon per minute to more than 800. The chemical quality of groundwater varies from place to place in the basin, and 80 percent of the wells yield water that is very hard (more than 180 milligrams per liter). Murfreesboro's water supply is furnished from a spring and from East Fork Stones River whereas Woodbury's water supply is furnished entirely from a spring. Four rural water utility districts buy water from these municipalities and pipe the water to the rural residents both inside and outside the upper Stones River basin. The potential water supplies of the municipalities of Woodbury, Readyvile, Murfreesboro, Lascassas, Walter Hill, Milton, and Christiana are described as to water availability and yield. (Glasby-USGS)

WATER RESOURCES OF WARD COUNTY, TEXAS,
Geological Survey, Austin, Tex.
D. E. White.
Texas Water Development Board Report 125, Feb 1971. 219 p, 31 fig, 9 tab, 48 ref.

Descriptors: *Hydrogeology, *Water resources development, *Aquifers, *Texas, *Groundwater, Water quality, Water yield, Recharge, Infiltration, Seepage, Return flow, Brines, Salinity, Evapotranspiration, Data collections, Hydrologic data, Withdrawal, Water wells, Water utilization, Consumptive use, Water balance.
Identifiers: *Ward County (Tex).

Ward County is an area of 827 square miles in the Pecos River Valley of West Texas. The county consists primarily of rolling uplands used largely for ranching. The Pecos River borders the county on the south and west. The flood plain and terraces along the river are extensively cultivated and irrigated. During 1967, total pumpage of groundwater from three aquifers totaled 34,400 acre-feet. Water for irrigation is supplied both by wells and from the Pecos River. In 1967, pumpage for irrigation was 9,200 acre-feet, and diversion of river water was 75,510 acre-feet. More than one-half of the water diverted was lost to seepage from canals. Natural recharge is estimated to be about 12,000 acre-feet per year, and about 45,000 acre-feet was added to this in 1967 by seepage and deep percolation losses. Natural discharge is estimated at 40,000 acre-feet, or about three times the amount of natural recharge. The quality of the groundwater ranges from fresh to brine. Additional development of the Allurosa aquifer is anticipated, with most of the water being obtained from the 10 million acre-feet that is estimated to be in storage. However, a large part of the water in storage is too highly mineralized for drinking purposes and can be used only to irrigate the more salt-tolerant crops. (Knapp-USGS)

CAPILLARY TUBE THEORY AND THE EFFECT OF THE PORE-SIZE DISTRIBUTION INDEX FOR DRAINAGE IN POROUS MEDIA,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Engineering.
Macra D. Alfajardo.
M Sc Thesis No 279, Asian Institute of Technology, 1969. 67 p, 9 fig, 9 ref, 2 append.

Descriptors: *Groundwater movement, *Saturated flow, *Porous media, *Pore pressure, Drainage, Porosity, Flow rates, Theoretical analysis, Model studies, Numerical analysis, Equations, Hydraulic conductivity, Capillary conductivity, Permeability, Water table, Analytical techniques.
Identifiers: *Pore-size distribution.

A theoretical investigation of the one-dimensional drainage of an initially saturated medium by the effect of gravity to a water table was studied. Approx-

imate solutions were developed describing the accumulated volume of flow per unit cross-sectional area to the water table as a function of time and measurable soil properties. The approximate solutions were obtained using an analogy of a capillary tube and the effect of the pore-size distribution index of porous media. The final solutions were given in an integral form which were numerically integrated. The validity of the theoretical equations were verified by comparison with experimental data obtained by previous investigators. (Woodard-USGS)

PORE-SIZE DISTRIBUTION OF A POROUS MEDIUM AND ITS APPLICATION,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Engineering.
Ying-Yeung Ho.
M Sc Thesis No 306, Asian Institute of Technology, 1970. 114 p, 30 fig, 8 tab, 22 ref, 3 append.

Descriptors: *Groundwater movement, *Porous media, *Porosity, *Pore pressure, Saturated flow, Drainage, Flow rates, Theoretical analysis, Model studies, Numerical analysis, Equations, Hydraulic conductivity, Capillary conductivity, Analytical techniques, Permeability.
Identifiers: *Pore-size distribution.

This theoretical investigation considered the characteristics of pore-size distribution of a medium and its applications. An equation relating the effective saturation with capillary pressure was proposed as the pore-size distribution function of the medium. Theoretical equations of hydraulic conductivity for wetting and nonwetting fluids were developed as functions of capillary pressure and saturation using the pore-size distribution proposed in this study. The theoretical equations were then verified by experimental data obtained by previous investigators. The pore-size distribution function was also applied to solve two case studies of drainage problems; one-dimensional vertical drainage of initial saturated media and two-dimensional drainage into open ditches or tile drains. The theoretical solution of the one-dimensional drainage was verified using numerical and experimental results from previous investigators. (Woodard-USGS)

THE SIGNIFICANCE OF THE OGALLALA FORMATION IN TEXAS,
International Center for Arid and Semi-arid Land Studies, Lubbock, Texas.
Frank B. Conselman.
In: The Ogallala Aquifer--a Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 2-4, 1970. 3 p.

Descriptors: *Aquifers, *Hydrogeology, *Texas, Reviews, Water yield, Water storage, Water utilization, Transmissivity, Permeability, Porosity, Withdrawal, Water quality, Groundwater movement, Recharge, Irrigation water, Water resources development.
Identifiers: *Ogallala aquifer (Texas).

The Ogallala aquifer of Texas underlies 35,000 square miles, and has an average saturated reservoir thickness of 140 feet. Porosity averages 30%, and specific yield is 15%. Transmissibility is about 30,000 gallons per day per foot. In 1968 the Texas Ogallala provided 9.8 million acre-feet of water, equal to 73% of all the groundwater withdrawals in Texas. Moreover, water withdrawn as groundwater from the Ogallala was almost twice as much as the total water usage from all surface storage in the state. Irrigation gets most of the present withdrawals; municipal and industrial use gets about 22%, AND A SMALL PERCENTAGE IS USED IN WATER—FLOODING OF OIL FIELDS FOR SECONDARY RECOVERY. These withdrawals far exceed recharge rates. (See also W71-08350 thru W71-08357) (Knapp-USGS)

THE OGALLALA FORMATION--A REVIEW,
Illinois State Geological Survey, Urbana.
John C. Frye.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 5-14, 1970. 10 p, 3 fig, 13 ref.

Descriptors: *Aquifers, *Hydrogeology, *Texas, Stratigraphy, Transmissivity, Permeability, Porosity, Water quality, Structural geology, Groundwater, Water resources development, Topography, Geomorphology.
Identifiers: *Ogallala aquifer (Texas).

The Ogallala formation was deposited during late Miocene and Pliocene time in pre-existing valley systems across the Great Plains by streams flowing eastward to southeastward from sources in the mountains. Late Tertiary or earliest Quatennary warping placed the coalescent alluvial deposits in a position vulnerable to Pleistocene erosion, and as a result they now stand as a plateau between the eroded mountain foreland and the central interior plains. Hydrologic properties of the Ogallala are strongly influenced by the predepositional topography, the aligment of the filled valleys and of the major channel gravels, and by the hydrologic barriers, particularly buried soils in the upper half of the formation. GEOLOGY AND GROUNDWATER IN THE OGALLALA FORMATION AND UNDIFFERENTIATED PLEISTOCENE DEPOSITS, SOUTHWESTERN KANSAS,
Geological Survey, Garden City, Kans.
Harold E. McGovern.
In: The Ogallala Aquifer--A Snymposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 15-29, 1970. 15 p, 9 fig, 10 ref.

Descriptors: *Aquifers, *Hydrogeology, *Paleohydrology, *Sedimentation, *Kansas, Strategraphy, Artesian wells, Water yield, Water levels, Water resources development, Withdrawal, Irrigation water, Permeability, Porosity, Transmissivity, Recharge, Groundwater movement.
Identifiers: *Ogallala Aquifer (Kansas).

As a result of subsidence in the underlying Permian red beds, Ogallala deposits in much of southwestern Kansas were buried beneath younger sediments. Early Pleistocene streams carved into the Ogallala, forming a deep southeast-trending valley system. Initial refilling of the basin was by alternating fine- to course-grained stream deposits followed by deposition of thick beds of fine-grained lacustrine sediments. During the late Pleistocene time, rejuvenated streams cut channels into older deposits and refilled the remainder of the basin with alternating fine- to course-grained sediments. The sequence of geomorphic events is reflected in the variety of unconfined and semiconfined conditions that exist within the groundwater reservoir. Wells in the upper materials generally show characteristics of an unconfined aquifer. Wells screened in the lower materials show characteristics of a semiconfined aquifer. Water levels are declining as a result of pumpage from more than 5,000 wells. The annual rate of decline depends upon the density of irrigation development, the intensity of pumpage, and the degree of aquifer confinement. Areas of great saturated thickness and intensive development have shown significant declines in artesian pressure, but well yields remain undiminished. (See also W71-08349) (Knapp-USGS)

Identifiers: *Well logging, *Ogallala aquifer (Te as).

The Geological Survey initiated a major study artificial recharge at Lubbock, Texas, in fiscal ye 1969. This paper deals with the use of geophysi well-logging in investigations of artificial rechar through water-spreading on the land surface. O of the major research efforts is to develop metho for measuring or estimating the vertical permeab ty of the unsaturated zone so that favorable sites surface spreading can be selected on the basis drilling, logging, and testing. Logging is used guide construction of air-permeability holes may be used to provide porosity and moisture d for the calculations. One of the purposes of logging and sampling is to describe the unsatura part of the Ogallala Formation with sufficient ac racy to permit development of a correlat between air and water permeabilities and ot lithologic parameters. on recent attempts to use deuterium as an inor of the origin of underground brines are reviewed. A low content of deuterium usually is considered a direct indicator of the infiltration origin of groundwaters. Facts indicate, however, that brines formed from prolonged evaporation also have a low deuterium content. A low deuterium content can be shown to be associated with a change in the brine composition during evaporation from a sodium brine to a magnesium brine, which results in a sharp change in the structure of the solution. The content of heavy isotopes in evaporation brines is influenced not only by isotope exchange between liquid and atmospheric vapor but also by the concentration of dissolved salts and their composition. It is assumed that the isotope composition of the waters of evaporite basins of various geological epochs differs from that of the waters of the world's oceans and that the waters of the basins may be either deficient or rich in heavy isotopes, depending upon the degree of brine concentration. The deuterium content cannot be considered as an indicator of the origin of underground brines; therefore, there is no justification for assuming an infiltration origin for a brine on the sole basis of a low deuterium content. THE HYDROGEOLOGICAL INVESTIGATION OF FISSURE-FLOW BY BOREHOLE LOGGING TECHNIQUES,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
Tom Keith Tate, Anne Shirley Robertson, and David Alfred Gray.
Quarterly Journal of Engineering Geology, Vol 2, No 3, p 195-215, Feb 16, 1970. 21 p, 4 fig, 5 plate, 5 tab, 13 ref, append.

Descriptors: *Groundwater movement, *Borehole geophysics, *Logging (Recording), *Electrical well logging, *Borehole cameras, Artesian wells, Fissures (Geology), Limestones, Aquifers, Aquifer characteristics, Karst.
Identifiers: *Borehole television.

The instrumentation and techniques developed for the investigation of fissure-flow in consolidated aquifers are described and illustrated by three case histories. The use of closed-circuit underwater television inspection of boreholes is outlined and consideration is given to the implications of flow rates by analysis of the tritium contents of some water samples. Borehole-logging methods were used to identify the strata forming the walls of the well, to locate fissures, and to measure the physical properties of the column of the water in the well. The identification and the location were undertaken with conventional logging equipment as well as with a closed-circuit underwater television camera. (Knapp-USGS)

SOME ASPECTS OF THE TRIASSIC AQUIFER IN EAST DEVON AND WEST SOMERSET,
Sherrell (Frederick) Engineering Geologists, Tavistock (England).
Frederick William Sherrell.
Quarterly Journal of Engineering Geology, Vol 2, No 4, p 255-286, May 27, 1970. 32 p, 15 fig, 9 tab, 14 ref.

Descriptors: *Water resources development, *Hydrogeology, *Aquifer characteristics, *Sandstones, *Limestones, Water wells, Water levels, Safe yield, Conjunctive use, Induced infiltration, Transmissivity.
Identifiers: *England, Devon (England), Somerset (England).

The geology of the Triassic in east Devon and west Somerset, England, is reviewed, and new information relating to aquifer thickness and the changes in particle size is presented. These factors, together with the degree of cementation of the strata, have a great influence on infiltration, storage and yield. Changes in lithology take place in the aquifers with latitude. These changes play a dominant role in groundwater yield. In the uncemented aquifer in east Devon, the yield from a borehole is closely associated with the saturated thickness, but local variations may occur, due to induced recharge from streams or rivers. The risk of saline contamination will prevent development of the aquifer in the coastal area of south-east Devon. In west Somerset, a yield of the order of 5000 gal/hr or less is to be expected. Although adequate infiltration may occur and a high theoretical yield may be indicated, the geological conditions are such that a dense distribution of small diameter boreholes, approximately 8 inches (0.203 m), would be required to bring about the maximum practicable abstraction. COMPARISION OF METHODS FOR DETERMINING THE SPECIFIC YIELD OF THE OGALLALA,
Southwestern Great Plains Research Center, Bushland, Tex.
Ordie R. Jones, and Arland D. Schneider.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 118-130, 1970. 13 p, 6 fig, 2 tab, 9 ref.

Descriptors: *Specific yield, *Aquifers, *Texas, Pumping, Nuclear moisture meters, Cores, Tracers, Groundwater movement, Withdrawl, Storage coefficient, On-site tests, Laboratory tests, Water levels, Recharge, Hydrogeology.
Identifiers: *Ogallala aquifer (Texas).

In order to evaluate and compare the results of different methods of determining specific yield, the specific yield of the Ogallala aquifer at the USDA Southwestern Great Plains Research Center, Bushland, Texas, was determined by (1) pump and recharge tests (2) the neutron method (3) tracer techniques and (4) laboratory analyses of cores. The method selected to analyze pump and recharge test data is important. Generally, Jacob's straight-line method gave smaller values of (S) than did the curve matching methods, although both are solutions of the nonequilibrium formula. The specific yield of the aquifer was also determined with a neutron moisture meter. Nitrate can be used as a tracer for water recharged to the Ogallala. The difference between the specific yields determined by tritium and nitrate was due mainly to difficulty in accounting for the nitrate present in the native groundwater. Specific yield values were determined for over 100 1-foot long 3-inch diameter undisturbed cores from the Ogallala at Bushland. The specific yield of the aquifer at Bushland is greater than 0.20 and is probably 0.22. The average specific yield determined by pump test was 0.15. (See also W71-08349 thru W71-08357) (Knapp-USGS)

WATER TRANSFER AT BEDROCK-ALLUVIUM CONTACTS,
Colorado State Univ., Fort Collins. Dept. of Geology.
James P. Waltz.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 145-153, 1970. 9 p, 5 fig, 6 ref.

Descriptors: *Groundwater movement, *Aquifers, *Colorado, *Groundwater basins, Discharge (Water), Recharge, Water management (Applied), Withdrawl, Simulation analysis, Water levels, Hydrogeology.
Identifiers: *Ogallala aquifer (Colo).

Preliminary investigations indicate that appreciable volumes of water may be passing through the contact between the alluvial aquifers and the supposedly impermeable bedrock in the High Plains, Kiowa-Bijou, and Black Squirrel Designated Basins of Colorado. The principal aquifer in the High Plains of Colorado is the Ogallala Formation of Pliocene age. The underlying bedrock consists mainly of the Cretaceous Pierre Shale Formation. In the northern portion of the area, however, the Ogallala Formation is underlain by the Oligococene White River Group. Groundwater is transferred from the Ogallala aquifer through the nearly horizontal channel deposits of the White River Group northwestward into the alluvium of the South Platte River. Quaternary and recent stream deposits are the principal aquifer in the Kiowa-Bijou basin. Beneath the alluvial aquifers lie the Cretaceous sediments of the Pierre Formation, Fox Hills Formation, and the Larmie Formation. Piezometric levels exceeded water table levels in several areas; hydraulic conditions cause groundwater to move from the Fox Hills aquifer into the alluvium in these localities. Preliminary results from a computer simulation of groundwater flow within a portion of the Black Squirrel Creek Basin show that approximately 4,000 acre feet of groundwater passes from the alluvial aquifer into the Fox Hills Sandstone each year. METHOD FOR ESTIMATING AVERAGE COEFFICIENT OF PERMEABILITY USING HYDROGEOLOGIC FIELD DATA,
Geological Survey, Cheyenne, Wyo.
Richard Howard Pearl.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 131-144, 1970. 14 p, 2 fig, 5 tab, 6 ref.

Descriptors: *Permeability, *Aquifers, *Kansas, Alluvium, Particle size, Groundwater movement, Laboratory tests, Anistropy, Stratigraphy, Regression analysis, Statistical methods, Correlation analysis, Hydrogeology.
Identifiers: *Ogallala aquifer (Kansas).

The relations between average permeability and particle-size distribution in the Ogallala aquifer of Kansas were derived by multiple regression. The only size fractions significantly correlated with permeability were found to be fine and very fine gravel. This result is in conflict with most laboratory studies wherein the permeability was found to be highly correlated with the smaller-size fractions. Most laboratory measurements are made on samples taken perpendicular to the bedding planes, but average permabilities of interest in the field relate to flow parallel to the bedding planes. Therefore, correlations between permeability to horizontal flow and the larger size fractions may be of greatest significance for field use. (See also W71-08349 thru W71-08357) (Knapp-USGS)

A MATHEMATICAL MODEL FOR DETERMINING AREAL DISTRIBUTION OF NATURAL RECHARGE IN THE NORTHERN HIGH PLAINS OF COLORADO,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
Donald L. Reddell.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 165-181, 1970. 17 p, 8 fig, 3 tab, 4 ref.

Descriptors: *Groundwater recharge, *Aquifers, *Colorado, *Mathematical models, Simulation analysis, Numerical analysis, Groundwater movement, Infiltration, Permeability, Water yield, Discharge (Water), Hydrogeology.
Identifiers: *Ogallala aquifer (Colo).

The average annual rate and areal variation of natural recharge to the Ogallala Formation in the Northern High Plains of Colorado were studied using a mathematical model checked by review data collections. The distribution of recharge appears to be largely a function of the surface conditions as reflected by the geology, soils and topography of the area. For instance, net recharge rates in excess of two inches per year are primarily confined to the sandhill portion of the study area. These sandhills lie mostly above the water table, have a permeability, and a poor surface drainage system. The total volume of net recharge to the Ogallala Formation in Northern Colorado was computed to be 405,000 acre-feet per year or an average of about about 0.82 inch per year over the entire study area. This compared favorably with a previous estimate of 0.85 inch per year. The finite difference method of calculating net recharge is limited in its quantitative results by the quality of the input data. The best check available of the applicability of the method to field conditions is shown by the close correlation between the net discharge calculation from the finite difference method and the amount of discharge as estimated from stream flow measurements on the north and south forks of the Republican River and the Arikaree River. GROUNDWATERS OF MAGNESITE KARST IN CZECHOSLOVAKIA (GERMAN: UNTERIRDISCHE WASSER DES MAGNESITKARSTES IN DER CSSR),
Stanislav Klir.
English abstract. Steirische Beitrage zur Hydrogeologie, No 20, Graz, p 5-22, 1968. 18 p, 5 fig, 5 ref.

Descriptors: *Karst, *Mine water, *Hydrogeology, Erosion caves, Clays, Mine drainage, Iron, Leaching, Solubility, Groundwater movement.
Identifiers: *Czechoslovakia, *Magnesite.

The karstification of the magnesite deposits in the carboniferous strata of the Slovacian Gemerides is directly related to the direction of large faults. The intensity of the karstification is proportional to the intensity of the faults. The fissures and caves of the magnesite karst are usually filled with ochre developed through precipitation of iron from underground water as well as through the leaching of the carbonate rocks. Liberal flow of underground water causes the discharge of ochre from the karst caves into nearby mine shafts. Reduction of the waterflow causes consolidation of the ochre. This consolidation is accompanied by swelling of the ochre, which endangers mining work in parts of the deposit in which the swelling causes accumulation of water in the karst caves. (Knapp-USGS)

J. Zotl.
English abstract. Steirische Beitrage zur Hydrogeologie, no 20, Graz, p 99-151, 1969. 25 fig, 1 tab, 18 ref.

Descriptors: *Hydrogeology, *Surface-groundwater relationships, Groundwater recharge, Water levels, Reservoir leakage, Alluvium, Alluvial channels, Terraces (Geological), Water level fluctuations, Water balance, Hydrologic budget.
Identifiers: *Leibnitzer Feld (Austria), *Austria.

The groundwater balance in the quaternary gravel body of the Leibnitz Feld, Austria, was studied by investigations conducted over a number of years. East of the Mur River most of the Leibnitz Field is occupied by the holocene river-meadow landscape; west of the Mur, Pleistocene glacial terraces are preserved. Seasonal water level fluctuations result from differences of the geological conditions, the recharge area and the influence of the river. The thickness of the groundwater body decreases from over 8 m in the extreme northeast of the Mur to 3--4 m in the south of the Leibnitz Field. Damming of the Mur in the course of construction of the power station near Gralla had effects on the groundwater body chiefly in the area on the right bank. There was an immediate and marked but ephemeral rise of the groundwater level; from mid-1965 onward, the natural tightness of the river-bed of the Mur soon stabilized conditions again. Water-table isohypses and serial tests of groundwater hardness justify the assumption that the water of the Mur has penetrated into the groundwater body no farther than 500 m westward. (Knapp-USGS)

GROUNDWATER IRRIGATION IN THE TIRASPOL' DISTRICT OF MOLDAVIA (RUSSIAN: OROSHENIYE PODZEMNYMI VODAMI TIRASPOL'SKOM RAYONE MOLDAVII),
A. I. Voronov.
Gidrotekhnika i Melioratsiya, No 1, p 53-58, Jan 1971. 6 p, 3 fig, 3 tab.

Descriptors: *Irrigation systems, *Irrigation wells, Artesian wells, *Reservoir storage, *Groundwater, Drawdown, Specific capacity, Aquifers, Water storage, Water analysis, Pumping plants, Vegetable crops, Rotations.
Identifiers: *USSR, Moldavia, Irrigation agriculture.

Irrigation agriculture in the Tiraspol' Rayon of Moldavia can be developed through the use of groundwater from artesian wells. The static level of groundwater of the region is at a depth of 40-90 m from the soil surface. Depth of water wells is between 90 and 140 m. Specific capacity of wells in the northeastern part of the rayon is 2-5 cu m/hr and in the southeastern part 10 cu m/hr or more. Analysis of water shows that total solids content in most drilled wells does not exceed 1 g/liter and the total hardness of water varies between 4 and 14 mg/liter. To effectively use groundwaters for irrigation it is advisable to store water from artesian wells in reservoirs. Subsurface irrigation systems constructed for the utilization of groundwater are simple in design, easy to operate, and fully pay for themselves in the first few years of operation. (Sefson-USGS)

SEEPAGE FACE EFFECTS IN UNSTEADY GROUND-WATER FLOW,
Wisconsin Univ., Madison. Water Resources Center.
Willard A. Murray.
Available from the National Technical Information Service as PB-199 831, $3.00 in paper copy, $0.95 in microfiche. Technical Report, OWRR B-021-WIS-1, Water Resources Center, The University of Wisconsin-Madison, 1970, 143 p, 21 fig, 10 tab, 56 ref, OWRR Project B-021-WIS (1).

Descriptors: *Seepage, *Free surface, *Dimensional analysis, *Aquifer, *Ditches, *Streams, Flow, Water table, Drawdown.
Identifiers: *Saturated region, *Fourier analysis, *Flow face.

The study deals with the effect of the seepage face on the location of the free surface in a two-dimensional unconfined aquifer adjacent to a ditch or stream. The analysis is restricted to considering flow only in the saturated region below the water table; unsaturated flow effects are neglected. Theoretical solutions were obtained for steady state conditions and for the transient case of instantaneous drawdown by using potential theory and standard Fourier methods. The steady state solution is a corrected form of that presented by Kirkham (1964), which was found to contain a flaw. The transient solution involves a simple extension of the steady state solution and reduces to the latter for large time. Both solutions are presented in infinite series form. For the steady state, theoretical results indicate that the simple Dupuit parabola will give entirely satisfactory predictions of free surface locations for moderate drawdowns. For the transient case, the derived solutions indicate that the seepage face length decays exponentially. Furthermore, the transient solution including the effect of the seepage face shows a marked difference from the simplified potential solution in which the seepage face effect is neglected, particularly for small times and for locations near the outflow face. Experiments were conducted using a Hele-Shaw viscous flow model to verify the theoretical predictions.

THE TEXAS WATER DEVELOPMENT BOARD COOPERATIVE STUDIES OF THE OGALLALA UNDERGROUND RESERVOIR,
Texas Water Development Board, Austin. Groundwater Div.
Gunnar Brune.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 227-242, 1970. 16 p, 9 fig, 13 ref.

Descriptors: *Aquifers, *Texas, *Groundwater recharge, *Surveys, Injection wells, Computer programs, Mapping, Subsurface investigations, Water storage, Stratigraphy, Hydrogeology.
Identifiers: *Ogallala Aquifer (Texas).

The Ogallala underground reservoir, underlying the High Plains, furnished 73% of the groundwater and 53% of the total amount of water used in Texas in 1968. The Ogallala reservoir represents approximately 51% of the total underground water storage capacity available in the State, including dewatered, fresh, and slightly saline reservoirs. It has been estimated that 134 million acre-feet of dry or unsaturated underground stroage capacity is available in the South High Plains alone. The remaining groundwater in the Ogallala reservoir has declined to very low levels in some areas. The average acreage irrigated per well has declined from 140 acres in 1950 to 84 in 1969. The Texas Water Development Board is concerned about these matters, and has undertaken two cooperative studies involving the Ogallala reservoir. The first study is in cooperation with the High Plains Research Foundation of Halfway, Texas. Using recharge and observation wells, the effects on the aquifer of using runoff water in recharge wells are determined. The second study is in cooperation with the U.S. Geological Survey. This study contemplates the possible use of the Ogallala reservoir for underground storage and transmission of imported or local surface water. Precipitation (Atmospheric), Wilting point, Leaching, Agronomic crops, Climatic data, Soils, Seasonal, Transpiration, Evaporation.
Identifiers: *USSR, Mountain Chernozems, Water regime, Moisture capacity, Chronoisopleths.

Mountain Chernozems of the Karachayevo-Cherkesskaya Autonomous Region are formed at a height of 700-1,600 m above sea level under optimal moisture conditions. A station was set up in the region of the Zelenchukskiy Strain-Testing Plot to study the water regime of a typical mountain Chernozem. For two years of observations the moisture deficit averaged about 130 mm in a 0-300 cm soil layer. Fall and winter precipitation averaged 180 mm and was sufficient to wet the entire 3-m layer to minimum moisture capacity. Discharge of water from spring storage of productive moisture in the 3-m layer of soil during the growing season averaged about 130 mm, with a maximum discharge of 180 mm observed in 1968. Total water discharge during the growing season ranged from 600 to 800 mm. Water discharge from the upper 50-cm layer of soil was 3-4% of the total discharge while that from the 3-m layer was 15-30%. It is concluded from cyclic variations in climate that the water regime of mountain Chernozems is of a periodic leaching type with a predominance of leaching phases. (Josefson-USGS)

PHASE COMPOSITION OF PORE WATER IN COLD ROCKS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
Malcolm Mellor.
Available from the National Technical Information Service as AD-719236, $3.00 in paper copy, $0.95 in microfiche. CRREL Research Report 292, Dec 1970. 59 p.

Descriptors: *Rock mechanics, *Freezing, *Temperature, *Thermal properties, Thermal expansion, Ice, Soils, Polar regions, Compressability, Cold weather construction, Mechanical properties.
Identifiers: Thermal analysis, Strain mechanics, *Pore water, *Interstitial water.

The phase composition of pore water in three types of rock subjected to temperature below 0C was explored by a variety of techniques. Freezing point depression was measured as a function of water content by differential thermal analysis, the results yielding relationships between unfrozen water content and temperature. In an effort to avoid the practical difficulties involved in differential thermal analysis, attempts were made to determine freezing characteristics indirectly by air penetration and mercury penetration techniques applied at ordinary room temperatures. Electrical conductivity measurements were made as a function of temperature down to -195C in an attempt to obtain information on characteristics of interfacial water films at low temperatures. Thermal strain was measured as a function of temperature in order to detect direct mechanical effects associated with phase changes, chiefly strain discontinuities brought about by volume changes in the pore water during rapid freezing and thawing. Finally, isothermal compressibility measurements, with pressures up to 27 kb, were made at -10C so as to determine whether the rock underwent step changes in volumetric strain at pressures corresponding to those of the phase boundaries for ice polymorphs.

POROSITY AND PORE-SIZE DISTRIBUTION OF SOIL AGGREGATES,
Minnesota Univ., Minneapolis. Dept. of Soil Sciences.
Shen-maw Lin.
Available from the National Technical Information Service as PB-199 836, $3.00 in paper copy, $0.95 in microfiche. Minnesota Water Resources Research Center, Bulletin 29, 1971. 32 p, 6 fig, 8 tab, 43 ref. OWRR Project A-006-Minn (3).

Descriptors: *Porosity, *Soil types, *Pores, Aggregate, Minnesota, Cultivated lands, Miscroscopic, Bulk density, Voids, Sand, Clay, Silt, Loess, Glacial drift.
Identifiers: *Pore-size distribution, *Glassbead displacement, *Hg-porosimetry, Intraaggregate, Interaggregate, Thin sectioning.

Differences in aggregate porosity due to soil type, aggregate size and cultivation condition were investigated using samples from 6 Minnesota soils. Porosity characteristics were determined by the glassbead displacement and thin section methods and with Hg-porosimeter measurements. Aggregate porosity was higher in soils developed on loess and lower in those on till. Porosities ranged from 0.253 to 0.497. Aggregate porosity of virgin soil was higher than that of cultivated soil. Specific pore volume of pores of diameters 0.012 to 17 microns ranged from 0.124 to 0.272 cc/g. Over 90% of the specific pore volume was contributed by pores of diameter greater than 0.2 microns. The proportion of intraaggregate porosity to the total porosity was found to be about 0.30 for cultivated soils and 0.30 to 0.40 for virgin soils. (Walton-Minnesota)

AGING EFFECTS ON SWELL POTENTIAL OF COMPACTED CLAY,
Technion - Israel Inst. of Tech., Haifa (Israel). Dept. of Civil Engineering.
Gabriel Kassiff, and Raphael Baker.
ASCE Proceedings, Journal of the Soil Mechanics and Foundations Division, Vol 97, No SM3, Paper 7951, p 529-540, Mar 1971. 12 p, 7 fig, 21 ref, append.

Descriptors: *Soil mechanics, *Clays, *Compaction, *Soil water, *Aging (Physical), Pressure, Soil structure, Soil water movement, Entropy.
Identifiers: *Compacted clay, Inundation, Swelling pressure.

The swelling potential of compacted clay, which develops upon inundation, is defined in terms of the parameters affected by aging. These parameters include swell pressure, volume change and suction. Because in nature the clay is exposed to water some time after compaction, the aging effects on the swelling potential are rather important. Compacted clay samples were aged for up to 90 days and then tested for swelling pressure and free swell using triaxial technique. It was found that the swell pressure, particularly at high initial densities, tends to increase with aging and then gradually decrease to the initial value of zero aging. The amount of swell (under practically zero load) was not markedly affected by aging. The peak values of the swelling potential amounted to two to three times the initial value, and were found to be dependent on the initial placement conditions of the clay. The results are explained by energy concepts, as well as by concepts mainly used in soil science such as thixotropy and entropy of clay-water systems. (Woodard-USGS)

ntifiers: *Lake Volta, *Ghana, *Metalimnion.

e Volta in Ghana has extended over former est and savanna-woodland habitats through 2 natic zones. The amount of organic matter sub-rged by the lake is enormous since no prior aring of vegetation occurred. In the first months the lake, large fish mortality and low oxygen els gave rise to many fears which were fortunate-njustified. When the dry harmattan winds reach area from the Sahara the lake is rigidly tified but in most areas the metalimnion is fairly p. Although some species of fish have disap-red from the lake, others have thrived and ched enormous population levels, creating a ductive fishery. A simple food web was con-cted for the more important species of the lake. ch of the high biomass is attributable to the sub-ged wood which directly and indirectly pro-s food for the fish. No one knows what will hap-to lake productivity when the wood decays, eby posing questions on appropriate long term eries programs. (Casey-Arizona)

riptors: *Sedimentation rates, *Mud-water in-ces, *Sulfur, *Mud, *Geochemistry, Sedi-t-water interfaces, Sulfates, Sulfur compounds, des, Craters, Lakes, Acidic water, Water istry, Clay minerals, Kaolinite, Hydrogen ion entration, Diagenesis, Mineralogy.
tifiers: *USSR, Kuril Islands, Crater lakes, Fu-oles, Chemosedimentation, Halloysite.

The geological and physico-chemical conditions of formation and mineral composition of native sulfur in mud sediments in crater lakes of the Kuril Islands are examined. The character of sediment accumulation in the lakes is determined by interaction of three basic factors: intense uptake of sulfur gases from bottom fumaroles, chemical aggressiveness of ultra-acidic waters, and washing away of clastic and pyroclastic material. The leading process in the formation of sulfur muds in acid crater lakes is chemical precipitation, by which fine-layered sediments of native sulfur (25-55%), opal, alunite and clay minerals are formed. Clay minerals are not formed in the lakes when water pH is less than 1.5; halloysite is formed when pH is 1.5-2.25 and kaolinite is formed when pH is greater than 2.25. Ferric sulfides are formed either at the mud-water boundary when pH is greater than 3 and Eh is less than plus 0.02 volts or in sediment furing diagenesis of muds. The sulfur accumulation rate in crater lakes is hundreds of times greater than ordinary sedimentation. In Lake Goryachcye, for example, average sulfur accumulation is about 48 kg/cu m a year. PLANT TEMPERATURES AND HEAT FLUX IN A SONORAN DESERT ECOSYSTEM,
Arizona State Univ., Tempe. Dept. of Botany and Microbiology.
Joan G. Gibbs, and D. T. Patten.
Oecologia, Vol 5, No 3, p 165-184, 1970. 13 fig, 26 ref.

Descriptors: *Arid lands, *Xerophytes, *Energy budget, *Heat balance, *Environmental effects, Ecosystems, Physiological ecology, Solar radiation, Temperature, Plant morphology, Arizona, Shrubs, Soil temperature, Conduction, Convection, Boundary layers, Humidity, Transpiration, Evaporation, Cooling, Condensation, Dew, Seasonal, Cacti, Deserts, Leaves.
Identifiers: *Sonoran Desert, *Vapor pressure deficit, *Adaptations, *Creosotebush, *Temperature profiles.

Thermocouple temperature measurements were made in spring and summer in 6 Sonoran Desert plant species: Opuntia engelmannii, O. bigelovii, O. acanthocarpa and Echinocereus engelmannii, which are cacti, and Larrea tridentata and Franseria deltoidea, which are shrubs. Daily temperature profiles were constructed and used to compare differing seasonal responses of the various species to desert heat load. Cacti absorbed and stored heat and their internal temperatures often rose well above air temperature. Their various high dissipation mechanisms include critical pad angles with the sun, spine reflectivity, convection, temperature-dependent reradiation and heat dissipation from apical stem to basal stem. The relative importance of each of these mechanisms differ between species. The shrub leaf temperatures were always close to air temperature. Their low surface area/volume ratios ensure the importance of convection as a cooling factor. (Casey-Arizona)

CYTOKININ ACTIVITY IN WATER-STRESSED SHOOTS,
Negev Inst. for Arid Zone Research, Beersheba (Israel). Div. of Life Sciences.
Chanan Itai, and Yoash Vaadia.
Supported by the USDA under contract FG-IS-32.
Plant Physiology, Vol 47, No 1, p 87-90, Jan 1971. 1 fig, 4 tab, 20 ref.

Descriptors: *Moisture stress, *Leaves, *Plant growth substances, Laboratory tests, Humidity, Radiochemical analysis, Plant physiology.
Identifiers: *Cytokinins, *Water potential.

Although plants are usually experimentally water-stressed by limited water availability to the root, they may also be stressed by increasing transpiration demands. Six-8 week old Nicotiana rustica plants were exposed for 30 minutes to an airstream. Subsequent tests showed that leaf cytokinin activity had been reduced as much as it decreased when roots were subjected to water stress. C-14-leucine uptake was also reduced in the stressed leaves and this reduction was not reversible by kinetin treatment. Cytokinin activity approached control levels after several hours in a humid chamber. Labelled kinetin distribution differed in stressed and non-stressed leaves. While changes in water potential transmitted to the roots may affect cytokinin synthesis, lowered levels in stressed detached leaves suggest molecular inactivation. (Casey-Arizona)

THE EFFECT OF WATER STRESS ON INDOLEACETIC ACID OXIDASE IN PEA PLANTS,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
B. Darbyshire.
Plant Physiology, Vol 47, No 1, p 65-67, Jan 1971. 2 fig, 1 tab, 14 ref.

Descriptors: *Plant growth substances, *Moisture stress, *Biochemistry, Plant physiology, Laboratory tests, Colorimetry, Enzymes.
Identifiers: *Auxin, *Seedlings.

It has been suggested that the presence of indoleacetic acid (IAA) oxidase in plant tissue is a measure of the physiological age of the tissue. Pea plant (Pisum sativum) seedlings were subjected to -10atm water stress for 6 hours then returned to water to recover for a further 3 hours. Homogenate IAA oxidase fractions were determined by colorimetry and protein fractions by UV absorption. Two protein peaks were isolated. One peak was associated with the first IAA oxidase peak, and increased during water stress. The second peak could not be associated with an IAA oxidase peak and decreased after water stress. IAA oxidase was 116% of control in stressed plants, and surprisingly, 162% in recovered plants. Interpretation of the results requires further data. (Casey-Arizona)

ECO-PHYSIOLOGY OF WESTERN AUSTRALIAN PLANTS,
Western Australia Univ., Nedlands. Dept. of Botany.
B. J. Grieve, and E. O. Hellmuth.
Oecologia Plantarum, Vol 5, No 1, p 34-67, 1970. 4 fig, 3 tab, 68 ref.

Descriptors: *Physiological ecology, *Moisture stress, *Arid lands, *Xerophytes, *Plant physiology, Transpiration, Leaves, Stomata, Drought resistance, Photosynthesis, Plant morphology, Cuticles, Soil-water-plant relationships, Biological communities, Water loss, Heat resistance, Turgidity, Root systems, Soil types, Mode of action, Drought tolerance.
Identifiers: *Western Australia, *Sclerophylls, *Adaptations, *Water potential, *Drought avoidance, Photosynthetic efficiency, Transpiration ratio, Root hairs.

Comparative accounts are given of 27 species of Western Australian native plants growing in various soil types in climatic regions varying from temperate to arid. A wide range of physiological variables were studied in relation to adaptive morphological structures in leaf types and root systems. Particularly important with reference to summer drought were water relations, heat resistance and photosynthetic efficiency. While drought avoidance was the commonest form of drought resistance, many drought tolerant forms were also present. Microphylly, vertical leaf orientation, sunken stomata, thick cuticles, hairs and shiny surfaces were common xeromorphic adaptations resulting in lowered leaf temperatures and reduced water loss. Common adaptive adjustments to water loss were increased reflectance, decreasing heat load and increased stomatal pathway resistance. Summer water loss was also significantly less in plants with tomentose leaves as opposed to glabrous leaves. Sunken stomata probably result in less photosynthesis reduction than transpiration reduction, resulting in a favorable transpiration ratio. Deep tap root systems occur in several species and are adaptations to drier conditions. The temperature tolerances of arid area plants are large and net photosynthesis temperature optima are higher. Saltbushes appear to be able to absorb moisture from a nearly saturated atmosphere. (Casey-Arizona)

VEGETATION CHANGE FROM A SAND DUNE COMMUNITY TO A SALT MARSH AS RELATED TO SOIL CHARACTERS IN MARIUT DISTRICT, EGYPT,
Alexandria Univ. (Egypt). Dept. of Botany.
Malak R. Rezk.
Oikos, Vol 21, No 2, p 341-343, 1970. 1 tab, 6 ref.

Descriptors: *Dunes, *Sands, *Salt marshes, *Halophytes, *Soil alkalinity, Calcium carbonate, Vegetation, Ecosystems, Habitats, Sodium, Calcium, Soil moisture, Hygroscopic water, Biological communities, Soil salinity.
Identifiers: *Egypt, *Mediterranean climate, *Exchangeable sodium.

Salt marshes, with their characteristic halophyte plant communities, are found along the Mediterranean coast west of Alexandria wherever there are depressions. Between these and the coast itself are unstabilized sand dunes, which then grade into stabilized dunes, and farther south into salt marshes. Soil salinity and alkalinity varies in these different areas and an attempt was made to relate it to vegetation. The plant communities were described and soil chemical properties measured at 5 different points along a transect between coastal dunes and salt marshes. Exchangeable Ca decreased from unstabilized to stabilized dunes, then increased sharply in the marsh soil, probably reflecting the importance of Ca carbonate in semiarid soil particle stabilization. Soil hygroscopic moisture increased progressively from coastal dunes to marshes. Soil salinity was similar in the dune habitats and sharply increased in the marshes. In the dunes, plant species composition varied directly with stability. In the more stable areas, organic litter buildup facilititated the occurrence of new species. The very saline marshy areas supported glycophytes. (Casey-Arizona)

IMBIBITION BY ALKALI SACATON SEEDS,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
O. D. Knipe.
Journal of Range Management, Vol 24, No 1, Jan 1971, p 71-73.

Descriptors: *Seeds, *Range grasses, *Absorption, *Moisture uptake, Moisture content, Colorado.
Identifiers: *Seeds, *Range grasses, *Imbibition, *Alkali sacaton, *Seed-water-relations, Imbibition rate, Exudation losses.

Air-dry samples of large and small alkali sacaton (Sporobolus airoides Torr.) seeds were sandwiched between blotters saturated with distilled water and imbibed for various periods of time. After imbibition the seeds were weighed and the percent of weight change (dry weight basis) was determined. Imbibition of water by the seeds progressed through three phases: (1) an initial period of rapid uptake lasting for approximately 4 hours, (2) a tapering-off period of slow or negative uptake (the large seeds actually lost weight during this period) that lasted approximately 7 hours in the large seeds and 2 hours in the small seeds, and (3) a period of gradual increase that lasted until sprouting occurred: the 28th hour in large and the 32nd hour in small seeds. The second stage apparently was due to exudation loss and possibly some loss of a mucilaginous membrane which envelops the seeds. The smaller seeds contain a greater proportion of the mucilage and thus imbibed more moisture and at a higher rate than the large seeds.

LIGHT DELAYS GERMINATION OF ALKALI SACATON,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
O. D. Knipe.
Journal of Range Management, Vol 24, No 2, p 152-154, Mar 1971.

Descriptors: *Seeds, *Range grasses, *Germination, *Light, New Mexico.
Identifiers: *Seeds, *Range grasses, *Germination, *Light effects, *Alkali sacaton, Light-germination-relations.

To determine if alkali sacaton is negatively photoblastic, seeds were placed in black petri dishes on moist blotters and allowed to imbibe moisture for 30 min at 90F. After imbibition the seeds were subjected to light treatment of 1000 ft-c intensity for periods ranging from flash to constant exposure. Exposure of alkali sacaton seeds to light for a few seconds after imbibition delayed germination 24 hr, exposure for 9 to 13 hr delayed germination 28 hr, exposure for more than 13 hr delayed germination 72 hr and continuous exposure reduced germination 40 percent.

A COMPARISON OF SEVERAL STATISTICA MODELS IN FOREST BIOMASS AND SU FACE AREA ESTIMATION,
Southeastern Forest Experiment Station, Ashevil N.C.
Hans T. Schreuder, and Wayne T. Swank.
In: Forest Biomass Studies, Misc Pub 132, Life S and Agr Exp Sta, Univ of Maine at Orono, p 12 136, 1971. 2 fig, 3 tab, 14 ref.

Descriptors: *Statistical models, *Biomass, *Wh pine trees, *Regression analysis, North Caroli Vegetation, Leaves, Estimating, Mathematics, S face.
Identifiers: Coweeta Hydrologic Laboratory.

The squared correlation and log likeliho techniques are discussed and used to evalu statistical estimation models for eastern white p biomass and surface area data. Three a priori lin models are considered: (1) an unweighted untra formed model, (2) a weighted untransform model, and (3) a log-log transformation model addition, a comprehensive model is conside which includes two of the a priori models and o standard models as special cases. The likeliho approach is demonstrated to be a useful statist tool for comparing dimensional tree compon models. The R sq criteria can be mislead Specifically R sq gave misleading results in sel ing the unweighted untransformed model over weighted untransformed model in five out of e cases. Considering only the a priori models, biomass parameters would be estimated by the log transformation and the weighted linear mo would be used for the surface area parameters. double square root transformation appears to promising alternative model.

Identifiers: Backwash, Swash zone.

Processes responsible for the production modification of morphological and sediment cal changes on the subaerial beach face we vestigated on some mixed sand and s beaches, Kaikoura, New Zealand. An instru

stem was constructed for the measurement of
ow speeds, pressures, asymmetries, depths, levels
groundwater storage and outflow, and of flow
rations. In association with the observations of
ese flow processes several responses to flow
gime were also sampled. These included altera-
ns to grain size parameters of bed sediments,
nsport rates of solids in the swash and backwash,
rtical distributions of sediment in both swash and
ckwash, and changes in bed elevation. An elec-
-mechanical force plate dynamometer was em-
oyed for the measurement of flow speed, force,
wer and duration and a small parallel wire gage
sed depth fluctuations in swash and backwash
ws. The output from both of these units was
corded on a strip chart for later analysis. A wide
ge of breaker heights, periods and types is
eived at four stations. More than 3,000 in-
idual measurements of swash/backwash flow
nditions were obtained from these four profiles
breaker heights of from 1.5 to 10.0 feet and for
aker periods ranging from 7.5 to 11.0 seconds.

ation, *Stratigraphy, Deposition (Sediments),
hydrology, Hydrogeology, Runoff, Alluvial
els, Saline waters, Saline water systems,
water intrusion, Water quality, Water
istry, Water resources development.
fiers: Mississippi Delta.

Quaternary delta deposits of the Missisiippi River, together with interbedded marine sediments, have a cumulative maximum thickness greater than 13,000 feet, of which the delta deposits constitute perhaps half. They underlie a coastal belt some 300 miles in length, and extend more than 150 miles southward from the coastline of southwestern Louisiana beneath the Gulf of Mexico. The late Quaternary deltaic mass contains almost no fresh groundwater, although streams that cross it carry runoff from 60% of the conterminous United States. This seeming paradox is caused by expulsion of saline waters from incompetent prodelta clay beds overridden by advancing deltaic sediments having a common framework and parent trunkstream source. Distributary channel deposits terminate gulfward in marine clay and join headwards with those of the trunk stream to form an integrated system of conduits, through which water expelled from compacting sediments is discharged upvalley. Because the delta is still growing, this discharge is continuing. It causes landward movements of saline groundwater, threatens some existing fresh-water supplies, and must be considered carefully in any developments of fresh-water resources in the delta. (Knapp-USGS)

SOME ASPECTS OF EROSION AND SEDIMENTATION IN AN ARCTIC DELTA DURING BREAKUP,
Louisiana State Univ., Baton Rouge, and Office of Naval Research, London (England).
H. J. Walker.
Also published as Louisiana State Univ. Coastal Studies Inst. Technical Report no 90, Nov 1970. In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Syposium, May 1969, International Association of Scientific Hydrology Publication no 90, p 209-219, 1970. 11 p, 19 fig, 15 ref. Contract no N00014-69-A-0211-0003, Project no 388 002 of the Geography Programs, ONR.

Descriptors: *Sediment transport, *Ice breakup, *Deltas, *Alaska, *Artic Ocean, Rivers, Lake ice, Erosion, Sedimentation, Sediment distribution, Permafrost, Melt water, Ablation, Streamflow.
Identifiers: *Colville River (Alaska).

In arctic deltas, the character and amount of erosion and sedimentation are affected by numerous factors not normally operating in other deltas. A long period of snow and ice cover, continous permafrost, a thin active layer and extreme variation in discharge are among some of the more important conditions involved. The Colville River, which drains much of arctic Alaska, has nearly half of its discharge and some three-fourths of its sediment load concentrated into the three- to four-week period accompanying and immediately following breakup. During this period thermoerosional niches form in the frozen riverbanks. The undercutting is frequently responsible for bank collapse and rapid bank retreat. Likewise, the bulk of the delta's deposition occurs during this short period of time. As sediment is deposited on bottom-fast river ice and on the sea at the front of the delta, much of it is often lost to the delta during breakup. (Woodard-USGS)

PRINCIPAL COMPONENTS ANALYSIS OF WATERSHED VARIABLES AFFECTING SUSPENDED SEDIMENT DISCHARGE AFTER A MAJOR FLOOD,
Pacific Southwest Forest and Range Experiment Station, Berkeley, Calif.
Henry W. Anderson.
Symposium on the Results of Research on Representative and Experimental Basins. International Association of Scientific Hydrology Publication No 96: 404-416, 1970.

Descriptors: *Erosion, *Suspended load, *Watershed management, *Analytical techniques, *Accelerated erosion, Lumbering, Regression analysis, Watersheds, Variability, Geomorphology, Topography, Drainage patterns (Geologic), Channels, Geologic control, Land use, Grasslands, Highways, Slope stability, California.
Identifiers: *Mountain watersheds, Logging, Multivariate analysis, Flow paths.

Suspended sediment discharge from 31 watersheds after two major floods in northern California exceeded pre-flood amounts by as much as 5 times. Increases the first year after the 1964 flood ranged from 0 to 7300 metric tons per square kilometer (21000 tons per square mile). Increased sediment discharge from watersheds depended on the relative size of flood, topography, and land use in each watershed. Poor land-use practices--specifically, placing logging roads adjacent to streams and temporary log storage areas (landings) in draws--was

associated with 70 percent greater increases in sedimentation after floods. High-elevation watersheds had the greatest increases--3 times more than low elevation watersheds. Equations related the decline of sedimentation to the year since each flood. Second year increases averaged 94 percent of first year. By the third year increases had declined to 66 percent of the first year increases. The amount and duration of increases in sediment discharge associated with changes brought about by large floods will affect watershed management decisions and programs requiring estimates of long-term sedimentation from watersheds.

CHARACTERISTICS AND PROCESSES OF SOIL PIPING IN GULLIES,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
Burchard H. Heede.
USDA Forest Serv Res Pap RM-68, 1971. 15 p, illus.

Descriptors: *Gullies, *Soil erosion, *Permeability, Soil stabilization, Colorado.
Identifiers: Exchangeable Sodium Percentage.

Soil piping processes and soil development were studied as a result of combined pipe and gully actions. Soils from gully side slopes with and without pipes showed a highly significant difference in exchangeable sodium percentage (ESP). Piping soils had a layer permeability 2 to 12 percent of that of soils without pipes. Both soils were fine texture. The interior of one soil pipe was thoroughly inspected, surveyed, and photographed from inlet to outlet. Based on the survey, and chemical and mechanical analyses, it is proposed that soil pipes on the Alkali Creek watershed developed mainly from soil cracks. Other causes such as rodent holes or dead root canals are presumed possible, but were not verified. Gullies, high exchangeable sodium percentage, low gypsum content, and fine-textured soils with montmorillonite clay appear to be prerequisites to the formation of soil pipes on the study area. ESP was significantly higher in piping soils in place than in those fallen from the gully side slopes. ESP decreased also with increasing time since fall. Natural reclamation of the fallen soils led to processes initiating gully stabilization.

MEASUREMENT OF CREEP IN A SHALLOW, SLIDE-PRONE TILL SOIL,
Pacific Northwest Forest and Range Experiment Station, Juneau, Alaska. Inst. of Northern Forestry.
D. J. Barr, and D. N. Swanston.
American Journal of Science, Vol 269, p 467-480, Dec 1970. 5 fig, 2 tab, 5 ref.

Descriptors: *Creep, *Soil mechanics, *Slope stability, *Soil dynamics, Clear-cutting, *Landslides, *Glacial soils, Mass wasting, Soil erosion, Engineering geology, Soil engineering, Soil physical properties, Alaska.
Identifiers: Southeast Alaska, Logged areas, Strain probes.

Strain probe measurements of creep in a steep glacial till soil were made in an area of active soil movement in southeastern Alaska. Estimates of creep indicate rates in excess of 0.06 m per year at the surface, rapidly decreasing to zero at an impermeable lower soil boundary. The soil apparently moves as a flow mass with no well-defined shear zones. Inferences from probe data and deformation of paraffin rods installed in active slopes suggest that movement exists the year round with the highest rate of movement occurring in the fall and spring when soil moisture is highest.
W71-08852

SEDIMENT MOVEMENT IN A POOL AND RIFFLE STREAM,
North Central Forest Experiment Station, St. Paul, Minn.
Edward A. Hansen.
International Symposium on the Results of Research on Representative and Experimental Basins, Wellington, New Zealand, Dec 1-8, 1970, IASH-VNESCO Pub 96, p 541-561, illus.

Descriptors: *Sediment transport, *Sediment discharge, *Particle size, *Bank erosion, *Bed load, Sediment load, Sediment yield, Stream erosion, Bottom sediments, River beds, Scour, Deposition (Sediments), Michigan.
Identifiers: *Sediment sampling, *Total sediment load.

A sediment budget was constructed for a pool and riffle stream along which eroding streambanks were the dominant sediment source. Total sediment load was measured with a DH-48 sediment sampler at artificial sills placed on the streambed at each of the five sampling stations, which eliminated an 'unsampled zone'. Supplementary data collected at each station and an independent check with a long-term reservoir fill rate indicated the 'sill samples' were accurate measures of total load for a wide range of sampling site hydraulic characteristics. The total load data were used to determine the impact of eroding bank sediments on both sediment load and streambed composition. Total load increased 530 percent along a 26-mile (42 kilometers) section of main channel; most of this increase came from eroding streambanks. However, particle-size distribution of the predominantly sand-size sediment load remained the same along the section of stream. The proportion of streambed area in sand decreased downstream, while the proportion in cobble and boulder increased -- an apparent result of increased stream gradient. Although sediment load was related to stream discharge, it was believed to be dependent upon sediment delivery rate to the stream.
W71-08862

DEPOSITION OF SEDIMENT IN TRANSIENT FLOW,
South Dakota State Univ., Brookings. Dept. of Civil Engineering; and Federal Highway Administration, Kansas City, Kans. Kansas Div.
Fred F. M. Chang, and Dennis L. Richards.
Supported by National Science Foundation and South Dakota Water Resources Institute. ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY6, Paper 8191, p 837-849, June 1971. 13 p, 4 fig, 1 tab, 14 ref, append. Project 3,569 SRI.

Descriptors: *Sediment transport, *Unsteady flow, *Deposition (Sediments), *Mathematical models, *Computer programs, Slopes, Alluvial channels, Suspended load, Bed load, Equations, Estuaries, Tidal effects, Numerical analysis.
Identifiers: Transient flow.

An analytical method of predicting the change in reiverbed elevation at transient phases is developed. A computer program is presented so that a sample computation can be made to check the stability and convergency of the method. For channels in which the sediment-laden water can be considered completely homogeneous and in which the velocity can be considered uniform over the cross section, equations of continuity and the equation of motion of sediment-laden water are presented. Introducing the assumption that the difference between the original bed slope and the new bed slope within a short period is very small, these three basic partial differential equations are successfully reduced to two partial differential equations. The method of characteristics is then employed to solve for the mean velocity and the mean depth of flow. In order to estimate the sediment deposit thickness, the equation of continuity for sediment is transformed directly to finite-difference form. (Knapp-USGS)
W71-08908

THE DEGRADATION OF LIAS CLAY SLOPES IN AN AREA OF THE EAST MIDLANDS,
Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
Richard John Chandler.
Quarterly Journal of Engineering Geology, Vol 2, No 3, p 161-176, February 16, 1970. 16 p, 7 fig, 3 plate, 14 ref, append.

Descriptors: *Landslides, *Clays, *Soil mechanics, Soil strength, Till, Groundwater, Geology, Hydrogeology, Degradation (Stream), Geomorphology, Consolidation.
Identifiers: Rutland (England), Northamptonshire (England).

A sequence of slope degradation was studied in an area in Rutland and Northamptonshire, England where a more rigid layer generally overlies a thick deposit of fissured, heavily over-consolidated clay. The capping of Inferior Oolite or boulder clay is locally associated with relatively steep slopes in the Upper Lias Clay with the consequence that shallow rotational slides have developed. The limiting angle of slope on which movement has occurred is about 9 deg and the maximum stable slope is 10 1/2 deg. Because of the comparative freshness of the landslide topography the virtual complete absence of such features as ungrassed scarps is unusual. Apparently, degradation is taking place only very slowly under present climatic conditions; asymmetrical valleys which have slides developed on the steeper southern slopes suggest that some of the movements may date back to the periglacial conditions of the Late Glacial period. ifiers: *USSR, *Kazakhstan, Amu Darya , Sedimentation waters, Jurassic period, ceous period.

istribution of uranium, radium, and deuteri- groundwaters of a Mesozoic cross section of ukharo-Karshinskiy artesian basin reflects a change in the geochemical state of the waters, with a definite correlation between radium and deuterium content. Data on uranium, radium, and deuterium content in combination with data on the geological structure of the basin show that the present character of the groundwaters of the basin is the result of two infiltration periods--the Mesozoic and the recent one--and make it possible to determine zones of infiltration water intrusion and the degree to which connate waters are diluted by them. Data on uranium, radium, and deuterium content in waters of Jurassic, Lower Cretaceous and Cenomanian-Albian water bearing complexes point to the connate nature of waters and to excellent isolation of the complexes from one another. From the content of radioactive elements and deuterium it is possible to solve problems of water genesis, determine the direction of flow of infiltration waters and to assess the extent of their supply. Identifiers: *USSR, *Crimea, Kerch Strait, Lithium, Rubidium, Barium, Ejectamenta, Breccia.

The solid ejectamenta of mud volcanoes of the Kerch-Taman' region are shown to contain large amounts of lithium, rubidium, boron, barium, strontium and other elements as compared with the sedimentary rocks developed outside the zone of mud volcano influence. Waters of the mud volcanoes contain 10-100 times more lithium, rubidium, cesium and boron than those of the world's oceans. In waters and breccia of two volcanoes in particular--the Shugo and Gladkovskiy--lithium, rubidium and cesium content is 3-5 times that of other volcanoes. Generally, waters and gases of the mud volcanoes of the region take an active part in forming the chemical composition of natural brine of lakes of the Kerch Peninsula and of Kerch iron ores of the Cimmerian age. Descriptors: *Thermal water, *Geochemistry, *Uranium radioisotopes, Chlorides, Sodium, Sulfates, Rocks, Acidic water, Igneous rocks.
Identifiers: *USSR, *Kamchatka, Thorium, Rare-earth elements.

The contents of uranium, thorium and rare-earth elements in chloride-sodium carbonate, sulfate-chloride-sodium carbonate, sulfate and carbonate thermal waters of Kamchatka were determined with an error of plus or minus 25-30%. Thorium: uranium and rare-earth: thorium ratios are calculated. Minimum concentrations of uranium, thorium and rare-earth elemets are found in deep chloride-sodium carbonate thermal waters. In sulfate waters the uranium concentration increases twofold and that of thorium and rare-earth elements 10- and 5- fold, respectively. It is assumed that uranium, thorium and rare-earth elements are present in a dissolved state in all types of waters and that country rocks are the source of these elements in the waters. A change in the chemistry of chloride-sodium carbonate and carbonate waters has no significant effect on the uranium concentration in them. The determining factor in this case is the low uranium content in the volcanogenic rocks of Kamchatka. Studies do not solve the problem of the juvenile component for iranium, thorium and rare-earth elements in thermal waters but its fraction is undoubtedly very small. (Josefson-USGS)

Descriptors: *Water temperature, *Salinity, *Pacific Ocean, Sea water, Water chemistry, Sampling, Surveys, Data collections, Bathythermographs.
Identifiers: Salinity-temperature relations (Pacific).

In general, sea-surface temperatures increase to a maximum toward the equator, and surface salinity reaches a maximum in the subtropics. Surface waters may be roughly classified into areas where temperature and salinity are positively correlated and areas where they are negatively correlated. Continuous-record data show that the transitions from one regime to the other take place abruptly in

some regions. In addition, the continuous records of salinity and temperature provide a means of immediately recognizing positions of oceanic fronts and advective phenomena. (Knapp-USGS)

HYDROBIOLOGICAL CHARACTERISTICS OF SHARK RIVER ESTUARY, EVERGLADES NATIONAL PARK, FLORIDA,
Geological Survey, Tallahassee, Fla.
Benjamin F. McPherson.
Geological Survey Open-file Report 71002 (Florida), Dec 1970. 113 p, 19 fig, 18 tab, 26 ref, append.

Descriptors: *Wetlands, *National Parks, *Florida, *Estuaries, *Water quality, Water level fluctuations, Water pollution effects, Droughts, Productivity, Wet seasons, Marshes, Swamps, Aquatic environment, Dissolved oxygen, Salinity.
Identifiers: *Everglades National Park (Fla).

Water quality in the Shark River estuary, Everglades National Park, Florida, is strongly influenced by seasonal patterns of rainfall, water level, and temperature. During the rainy season (summer and early fall) the salinity in the 20-mile long estuary ranges from that of fresh water to half that of sea water while concentrations of dissolved oxygen are low, 2-5 milligrams per liter. During the dry season (late fall through spring) the salinity ranges from 18 grams per liter (g/l) in the headwaters to 36 g/l at the Gulf during a dry year such as 1967 and from 1 to 25 g/l during a wet year such as 1969. The patterns of distribution of planktonic and small nektonic animals in the estuary are related to salinity. The presence of large numbers of juvenile and young animals indicate the importance of these brackish waters as nursery grounds. Small fish and prawns, which concentrate in the headwaters as the water level dropped, serve as a rich source of food for predatory marine fish and birds. (Knapp-USGS)

STRATIFICATION AND MIXING IN COASTAL WATERS OF THE WESTERN GULF OF MAINE DURING SUMMER,
Woods Hole Oceanographic Institution, Mass.
Edward M. Hulburt.
Journal Fisheries Research Board of Canada, Vol 25, No 12, p 2609-2621, 1968. 6 fig, 8 ref. AEC Contract AT (30-1)-1918.

Descriptors: *Sea water, *Temperature, *Fog, *Stratification, *Mixing, Solar radiation, Gulfs, Tidal effects, Winds, Thermal stratification, Weather, Currents (Water), Maine.
Identifiers: *Gulf of Maine, Coastal waters, Bay of Fundy, Casco Bay (Maine).

The low temperatures (between 11C and 13C) of surface water along the western coast of the Gulf of Maine indicate an active vertical mixing of water layers associated with tidal currents. High temperatures of 17C cause a pronounced stratification of water. The high temperatures were observed during the prevalence of fogs allowing heating of water during clear periods and a reduced cooling at night. (Wilde-Wisconsin)

Water Research, Vol 4, No 7, p 477-484, July 1970. 5 fig, 1 ref.

Descriptors: *Estuaries, *Flow measurements, *Mathematical models, *Saline water intrusion, Mathematics, Sea water, Water quality control, Reynolds number, Mixing, Saline water-freshwater interface, Velocity.
Identifiers: Seawater intrusion length measurement.

The intrusion of seawater into estuaries is caused by density differences between seaward flowing river-water and seawater. An understanding of estuary flow conditions is essential to solving estuarine problems. Mathematical models for determining seawater intrusion length are presented. Formulas for representing estuary parameters and length correction factor are derived with field data demonstrations. In real estuaries the estuary shape factor is essential in determining the seawater intrusion length. Another important factor is the Reynolds number for the river, which introduces the factor of transition from one type of flow to another for certain riverflow velocities. Observations are made showing the importance of these two factors in the general formulaization of seawater intrusion length. (McEntyre-PAI)

ifiers: *Rocky Mountains, Fraser Experimen- orest, Colorado, Water Resources Program.

l snow-cover depletion and resultant snowmelt water yield were studied on three small rsheds in the Fraser Experimental Forest. er water yield efficiencies were observed on watersheds which had: (1) almost complete cover when seasonal snowmelt rates on all r aspects were maximum; (2) a delayed and snow-cover depletion season; and (3) rate recharge and evapotranspiration losses. r yield efficiency in one watershed with low- tion south slopes was least. In 1969, stream- from the drainage area on this basin below feet was less than 30 percent of that ated from above this elevation. Fourteen of comparative streamflow indicated that yields from the low elevation subdrainage ary from near zero in poor runoff years to a num during good years of about 50 percent of low generated from the high elevation sub- age.

JECT SKYWATER, PROCEEDINGS, SKY ER CONFERENCE II. DESIGN AND LUATION OF WEATHER MODIFICATION ERIMENTS.
u of Reclamation, Denver, Colo. Office of spheric Water Resources.

able from the National Technical Information ce as PB-196 197, $6.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation report REC-OCE-70-58, Oct 67. 357 p.

Descriptors: *Clouds, *Weather modification, *Cloud seeding, *Cloud physics, Nucleation, Silver iodide, Ice, *Artificial precipitation.
Identifiers: Cumulus clouds, Design convection, Computerized simulation, Skywater project.

The Bureau of Reclamation's Atmospheric Water Resources Program, Project Skywater, is developing the capability to apply precipitation management techniques to the solution of our nation's water needs. Evolutionary processes leading toward the best precipitation management system require the identification and analysis of the many problems in weather modification. The design and evaluation of weather modification experiments were presented at Skywater Conference II, and the importance of conducting field experiments in such a way that definitive answers to the posed questions can be given was stressed. Statisticians and experimental design people emphasized the need for allowing adequate time to obtain results. Their advice contained a caution that being in too great a hurry usually resulted in experimental failure, and that the more uncertainties involved in a particular experiment, the more the need for randomization. Experiments conducted in rugged terrain and under extreme weather conditions pose special problems. These problems added to the problems of adequate measurement of many parameters and new capabilities for measuring other parameters make the design of meaningful experiments extremely difficult.

PROJECT SKYWATER, PROCEEDINGS, SKYWATER CONFERENCE I PHYSICS AND CHEMISTRY OF NUCLEATION.
Bureau of Reclamation, Denver, Colo. Office of Atmospheric Water Resources.

Available from the National Technical Information Service as PB-196 196, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation report REG-OCE-70-57, July 1967. 419 p.

Descriptors: *Weather modification, *Cloud seeding, *Nucleation, *Cloud physics, *Artificial precipitation, Silver iodide, Meteoric water, Chemistry of precipitation.
Identifiers: *Cloud modification, Orographic precipitation, USBR Research Contracts, Skywater Project, Pyrotechnic.

The Bureau of Reclamation's Atmospheric Water Resources Program, Project Skywater, is developing the capability to apply precipitation management techniques to the solution of our nation's water needs. Evolutionary processes leading toward the best precipitation management system require the identification and analysis of the many problems in weather modification. Skywater Conference I reviews the physics and chemistry of nucleation and the state of knowledge of these processes, and points out the importance of continuing research in this area. A consensus indicated that effective nucleants now exist, but there is doubt that any material now in existence is ready to be made the basis of a large-scale operational precipitation management program. Nucleants must be tailored to cloud requirements, and a variety of nucleants used in sequence might be the eventual operational system. The need for alternatives to the use of large amounts of silver in an operational precipitation management program was stressed. (USBR)

CONTENT OF ADENOSINE PHOSPHATE COMPOUNDS IN PEA ROOTS GROWN IN SALINE MEDIA,
Hebrew Univ., Jerusalem, (Israel). Dept. of Botany.
Edna Hasson-Porath, and Alexandra Poljakoff-Mayber.
Supported by a grant from the USDA (PL 480, A10-SWC-7; F9-IS-179). Plant Physiology, Vol 47, No 1, p 109-113, Jan 1971. 1 fig, 4 tab, 20 ref.

Descriptors: *Saline water, *Soil-water-plant relationships, *Phosphates, *Plant physiology, *Biochemistry, Sodium chloride, Sodium sulfate, Phosphorus compounds, Enzymes, Metabolism, Roots.
Identifiers: *Adenosine triphosphate, *Adenosine diphosphate, *Phosphorylation, *Phosphatases, *Nicotinic adenine dinucleotide, Mitochondria.

It is known that various metabolic pathways of pea plant (Pisum sativum) roots are altered when exposed to saline media. Attempts were made to determine whether changes are induced in adenosine phosphate levels in response to saline media. Both sodium chloride and sodium sulfate caused decreases of 60-70% in the ATP/ADP ratio in the root tissue when salinity was varied from 0-5 atm. Phosphatase and ATPase activity in soluble and mitochondrial fractions of sodium chloride-salinized plants were considerably higher than control levels, but were unaffected in sodium sulfate-salinized root mitochondria. Probably, then, oxidative phosphorylation is also directly affected by saline media. Salinity-induced mitochondrial phosphorylation depression was partially, but not completely reversed by the presence of NAD. Addition of sodium chloride to the reaction mixture did not affect phosphatase activity, but in some cases, sodium sulfate addition depressed it. (Casey-Arizona)

BRAK, A THREAT TO OUR IRRIGATION SCHEMES,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Soil Science.
M. Hensley.
South African Journal of Science, Vol 66, No 6, p 180-181, June 1970. 6 ref.

Descriptors: *Saline soils, *Alkaline soils, *Irrigation effects, *Leaching, Evapotranspiration, Calcium, Sodium.
Identifiers: *Leaching fraction, *Waterlogging.

Brak soils are alkaline, saline or saline/alkali soils. Brak is a chronic problem in irrigated lands. Usually the soil solution becomes 2-10 times more saline than the water by which it is irrigated. Salt concentration results from evapotranspirational water loss, and to prevent concentration, it is necessary to apply more irrigation water than that required to satisfy evapotranspirational demand. Once irrigation begins, soil salinity and exchangeable sodium should be carefully watched. Reclamation is through draining, leaching and replacement of exchangeable sodium by calcium. In South Africa, a brak survey of existing irrigation schemes and research on soil water movement are needed. It is necessary to be able to predict long term irrigation effects on each soil type and to integrate this into the planning of future irrigation schemes. (Casey-Arizona)

FURTHER STUDIES OF EUROTIA LANATA GERMINATION IN RESPONSE TO SALINITY,
Utah State Univ., Logan. Dept. of Range Science; and Utah State Univ., Logan. Ecology Center.
Lesley D. Clark, and Neil E. West.
Southwestern Naturalist, Vol 15, No 3, p 371-375, Feb 20, 1971. 2 tab, 7 ref.

Descriptors: *Saline soils, *Germination, *Halophytes, *Ecotypes, Seeds, Chlorides, Salts, Salt tolerance, Sulfates, Calcium, Potassium, Sodium, Sodium chloride, Utah.
Identifiers: *Seedlings.

An effort was made to determine whether winterfat (E. lanata) shows ecotypic variations within 1 valley. Seeds were collected at 3 sites in Curlew Valley, Utah: a pure bottom stand, a mixed bottom stand and mixed bench stand. The study employed a random block design with 4 replications at 4 levels of NaCl, Na carbonate, Ca chloride and K sulfate (0.0, 0.5, 1.0 and 2.0% solutions in 1.5% agar). All germination percentages decreased as salt level increased but differed significantly between salt levels and between seed sources for 3 of the salts. Chloride salts caused greater germination depression than sulfate salts. Annual germination differences are probably related to differences in seed source, production time and climatic differences. Nevertheless, the data suggests ecotypic differences between seeds from sites less than 1 mile apart. (Casey-Arizona)

Descriptors: *Leaching, *Acidic soils, *Sea water, *Sulfates, *Land reclamation, Irrigation practices, Drainage, Reclamation, Soil chemistry, Water chemistry.
Identifiers: *Indonesia, *Indochinese Peninsula, *Acid-sulfate soils.

Acid sulphate soils are very widely distributed in the ECAFE region. Extensive areas are found along the coasts of Kalimantan in Indonesia. Some one million hectares are reported from the Mekong delta. Tests with an acid-sulphate soil sample from the San Francisco Bay area used the high-salt water dilution method for leaching and reclamation of sodic soils. Short columns of the soil were leached with various amounts of synthetic sea water and/or a five-fold dilution of sea water, followed by distilled water in each case, to determine changes effected in the pH and exchangeable-cation composition of the soil. The treatments applied and the results obtained are summarized. Leaching with sea water removes large amounts of Al, increases soil pH appreciably, and increases base saturation to some extent. The increases in base saturation result from increases in exchangeable Na and K, with the content of exchangeable Ca..Mg actually decreasing slightly. (Knapp-USGS)

WARM WATER UTILIZATION,
Oregon State Univ., Corvallis. Dept. of Soils.
L. Boersma.
Oregon State University, 1970. 49 p, 9 fig, 13 tab, 14 ref. OWRR Project B-009-ORE (1).

Descriptors: *Water reuse, *Heated water, *Energy, Thermal water, Heat transfer, Agriculture, Power plants, Industries, Waste treatment, Aquatic animals, Heat budget, Soils, Social value, Cost analysis, Monetary benefits, Energy conversion.
Identifiers: *Waste heat.

Utilization of thermal water resulting from power generating plants as a supply of energy is proposed. The potential uses include heating homes, greenhouses, animal enclosures, soils, fermented organic wastes, and cultures of water inhabiting organisms. To avoid a loss of the valuable resource, the water may be recycled in a closed system, routed through either a soil warming loop, or evaporative cooling coils. Detailed information is included on the relation of heat and soil temperature, extensive and intensive cooling systems, production of farm crops, fish and algal cultures, and cost analysis. From 1957-1962 about 10,000 ha. were intensiv
surveyed in the Negev Desert of Israel in order
elucidate the irrigation farming techniques of s
cessful ancient agricultural civilizations. Two pr
cipal methods of 'runoff agriculture' recogni
were: farm units based on small watersheds and v
ley units based on large watersheds. Intricate wa
distribution systems, utilizing highly sophistica
irrigation engineering techniques, ensured
flood control. In order to test the validity of th
conclusions, 2 typical ancient farms were rec
structed and farmed almost exactly as the ancie
had. Over the past decade, these experime
farms have yielded a number of valuable resu
(1) In even the most extreme drought years, at l
1 flood supplied enough irrigation water to sus
the agriculture; (2) the efficiency
microcatchments (up to 0.1 ha. in area) in aver
annual water harvest were 20-30 times greater t
large wadis; (3) slopes of 2-3% gave the hig
water yields, which could be increased by clea
them of stones; (4) a large variety of crops coul
grown, and proved more drought-resistant than
merly thought, indicating that irrigated crop
general are overwatered. (Casey-Arizona)

Identifiers: *Population pressures.

The major form of land utilization in most ar
gions is animal production through grazing.
lation increases in most arid lands imply tha
social and resource utilization factors mu
revised. Arid zones present several unique f

t render their development difficult: (1) Intensi-
of use is low in comparison with more favored re-
ns, and misguided attempts at overintensifica-
n more quickly lead to environmental degrada-
n; (2) Capital inputs yield relatively low incre-
nts in production, thereby discouraging inflow
new capital; (3) Intensification must be horizon-
rather than vertical, owing to limited absorptive
acity; (4) Land uses have been poorly in-
rated and multiple usage has been limited; (5)
st countries with arid zones have been reluctant
invest in research and development, preferring
re intensive exploitation of their humid regions.
umber of detailed suggestions are advanced, in-
ving institutional mechanisms, resource evalua-
, education, research, institutional reorganiza-
, capital incentives and water development.

tifiers: *India, *Developing countries, *Green
olution, *Central Arid Zone Research Institute,
ordinated research.

nderdeveloped countries such as India, the
ority of the population is employed in relatively
icient agriculture. The need to raise per capita
luctivity is great, and agricultural intensifica-
must be vertical, since there are few remaining
xploited lands. The organization and goals of
Indian Council of Agricultural Research and
Central Arid Zone Research Institute are
ribed. Indian research experience indicates
coordinated research projects, concentrating
single problem category, are extremely suc-
ful. Crop improvement projects funded by
erican foundations and universities have been
uccessful that they have led to the 'green
olution'. In the arid zone, crop varieties have
developed that mature during the short rainy
on. Groundwater surveys, tube well construc-
and desalination research combined with soil
es and new irrigation methods are increasing
agriculture in the arid zone. However, great
hasis is also being placed upon water use effi-
cy which is leading to increased crop intensifi-
n. Agricultural education methods are also in-
fying. The Indian approach to agricultural
nology transformation is a massive effort.

ifiers: *Overgrazing, *Population pressures.

Mexico has a prolonged empirical precolonial backlog of utilization of extremely limited arid lands resources. The introduction of metal tools, cultivation and domestic livestock by the Spaniards widened exploitation of the arid zone. Initial ecological studies indicate that even in areas of small human populations, native wildlife and native vegetation have been drastically reduced, less productive wood plants have greatly extended their ranges, and wind erosion is widespread. However, intensive developments and improvements have also occurred. The arid zone states of the northeast and northwest have experienced massive irrigation development problems and with this have come widespread usage of fertilizers, mechanized equipment, crop diversification, extension services and agricultural research facilities. Other, less favored areas, have not been as extensively developed but are recipients of the advantages of a national commitment to agricultural research. Many projects are described: improvement of livestock forage, irrigation salinity, improved crop stocks, native plant utilization, goats, fertilizer experiments and crop gene banks. (Casey-Arizona)

NORTH AFRICA: PAST, PRESENT, FUTURE,
Food and Agriculture Organization of the United Nations, Rome (Italy). Plant Production and Protection Division.
H. N. Le Houerou.
First part of a paper presented at an international conference, 'Arid Lands in a Changing World', Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 227-278, 1970. 36 fig, 11 tab, 65 ref.

Descriptors: *Social aspects, *Arid lands, *Regional analysis, *Ecology, *Water resources, Vegetation effects, History, Human population, Human pathology, Grazing, Farming, Land resources, Productivity, Soil conservation, Water conservation, Salinity, Irrigation practices, Livestock, Social impact.
Identifiers: *North Africa, *Population pressures, *Desertification, *Potential evapotranspiration, *Land degradation.

The 4 countries of North Africa (Morocco, Algeria, Tunisia and Libya) share a common history and many similarities in both natural conditions and human populations. The various climates, soils, physiographies, vegetation and water resources of the area are described in detail and bioclimatological maps are presented. For over 12 centuries, the history of these regions has been characterized by endless warfare between nomadic and sedentary populations, which together with famines and epidemics, established an equilibrium between agricultural productivity and human population. The colonial conquests of the 19th and 20th centuries broke this equilibrium by establishing peace and introducing modern hygiene and medicine. The resulting population pressures have intensified forest degradation, water resource exploitation and soil erosion. Desertification, because of population pressures and bad agricultural practices, proceeds at the rate of 100,000 ha/yr. Some soil and water conservation methods are suggested. (Casey-Arizona)

DESERTS OF ASIA,
Leningrad State Univ. (USSR). Dept. of Geography.
M. P. Petrov.
Presented at an international conference, 'Arid Lands in a Changing World', Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 279-302, 1970. 12 fig, 14 ref.

Descriptors: *Agriculture, *Deserts, *Water resources, *Mineral industry, *Oil industry, Industrial production, Biomass, Productivity, Groundwater, Diversion, Irrigation programs, Social aspects, Grazing, Solar radiation, Rainfall, Desalination, Surface waters, Transportation, Greenhouses.
Identifiers: *Thar Desert, *Central Asia, *Middle East.

Desert resources include 3 main aspects: biological productivity, water and mineral resources and solar and wind energy. Although biological turnover is rapid, biomass reserves are small, and the low biological productivity places severe limits on animal husbandry. When water resources are combined with solar radiation (irrigation), productivity may leap sharply. Much attention has been paid to subsurface water exploitation and it appears that such reserves are much higher in Asian deserts than formerly thought. In contrast to biological productivity, mineral resources of the deserts (oil, gas, metals, etc.) possess very high economic potential and stability. Through modern technological developments, and better transportation networks, the exploitation of Asian deserts is currently proceeding on a massive scale, particularly in the USSR. This is leading not only to agricultural and industrial changes but also to social changes. The development in the deserts of Soviet Central Asia of large water diversion and irrigation projects, resource exploration, grazing, mineral deposits, water resources, industry and transportation are described in detail. Developments in Chinese central Asia, the Middle East and the Thar Desert of India are also briefly discussed. Many aspects of modern technology such as pipeline construction, mining, desalination and desert hothouse agriculture are considered extremely promising, and arid land exploitation will probably continue to increase in the foreseeable future. (Casey-Arizona)

GEOGRAPHIC CONSIDERATIONS IN PLANS FOR DEVELOPMENT,
Hebrew Univ., Jerusalem (Israel). Dept. of Geography.
David H. K. Amiran.
Presented at an international conference, 'Arid Lands in a Changing World', Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 89-103, 1970. 4 fig, 5 ref.

Descriptors: *Arid lands, *Geographical regions, *Irrigation practices, *Social aspects, *Economic feasibility, Semiarid climates, Tourism, Speciality crops, Regional analysis, Desalination, Technical feasibility.
Identifiers: *Developing nations, *Technical assistance.

In arid zones, the realities of water scarcity and soil conditions rule out the practices of traditional agriculture or pastoralism by large populations. Large-scale irrigation projects are ruled out as major developmental factors in most arid regions. Irrigation is a form of advanced regional development which therefore requires an elaborate regional infrastructure of transportation, powerlines and social services. However, the typical discontinuous distributions of arid land settlement patterns to restricted areas of intensive occupance separated by wide unoccupied areas renders such infrastructural economics unrealistic. Additionally, high evaporative demand lowers the yield efficiency per unit of irrigation water, making initial investment costs extremely high. Desalinization will not be a panacea for arid lands either, even in coastal deserts. It is felt that 2 types of industry are most realistic for arid lands: (1) Tourism, (2) Off-season agriculture producing specialty crops for out-of-region markets, that command high unit prices. The major difficulties involving arid zone technical assistance are the requirements of risk capital which is usually more realistically commanded in other areas and the problem of transferability of technical assistance between populations at different levels of technological and managerial competence and between different climatic environments. (Casey-Arizona)

PRODUCTIVITY OF ARID AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Rangelands Research Unit.
R. A. Perry.
Presented at an international conference 'Arid Lands in a Changing World', Tucson, Arizona, 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 303-316, 1970. 5 fig, 2 ref.

Descriptors: *Arid lands, *Productivity, *Land use, *Water resources, *Grazing, Sheep, Cattle, History, Land management, Land tenure, Vegetation effects, Economic feasibility, Transportation, Social aspects, Soil erosion, Soil types, Foreign lands, Political aspects, Environmental effects, Geographical regions, Mining.
Identifiers: *Australia.

Australia contains the largest desert land area of any country in the world. Nevertheless, 97% of her 12 million people live in the relatively fertile, highly industrialized coastal 'boomerang' of the southeast. Further the coastal 'boomerang' is largely independent of the arid zone, producing enough food and fiber for its needs, while still having reserve space and resources for greatly expanded production. In a sense, then, the arid zone is a uniquely giant appendage to the coastal strip, and this has resulted the allocation of very few national resources for its development. The arid zone receives most of its rainfall in the summer, and as in all arid regions it is highly erratic. In other respects, it is singular. It is traversed by no high climate affecting mountain ranges or any permanent exogenous rivers. Soils are thin and infertile and there are no spiny or succulent plants. Indigenous perennials are of fairly low nutrient values, the best forage being annuals that occur only in rainy years. Most stock water supplies must be man-made and represent relatively high capital investments. Because of high transportation costs, only sheep and cattle may be economically raised. On the credit side, pests and diseases are minimal. Social problems are engendered by the vast land area, and medical, educational and cultural services are difficult to provide. The history, economics and land tenure system of the area are reviewed. Overexploitation and neglect are reducing the already low productivity of many areas, and the author feels that the nation is committing a serious error in its indifference to the problems of the arid region. LAND USE ECOLOGY AS A THEME IN BIOGEOGRAPHY,
Durham Univ. (England). Dept. of Geography.
I. G. Simmons.
Canadian Geographer, Vol 14, No 4, p 309-322, Winter 1970. 2 tab, 37 ref.

Descriptors: *Biogeography, *Ecosystems, *Land use, *Productivity, *Biological communities, Agriculture, Grazing, Forestry, Food chains, Food webs, Biomass, Watersheds, Xerophytes, Trophic level, Energy conversion, Water conservation, Ecological distribution, Environmental effects, Mode of action.

In reviewing land use systems, ecosystems are looked at from the human standpoint. The dimension of human culture is important because many resource processes which are ecologically possible are culturally unacceptable. Ecosystems are considered as layered trophic levels, characterized at each level by taxonomic and numerical diversity. Biogeochemical cycling through levels may be represented by food chains or food webs, and stability is related to organismic diversity, since the buffering capacity to change in the ecosystem increases with numbers of species. Human activities usually affect ecosystem simplification by decreasing species diversity and energy pathways. An extreme case is modern agricultural monoculture such as cornfields, where stability is maintained by high inputs of matter and energy. Man may also affect systems by altering their critical limits. Land set aside for recreation or conservation is usually the least affected, and only esthetic satisfaction is gained. In water catchment areas, although localized changes may occur from terrestrial to aquatic systems, the watershed itself is little affected. Grazing is the extensive pastoralism of a selected domesticate, with all other herbivores considered pests. Badly controlled grazing often creates tremendous changes in ecosystems, such as the invasion of semiarid grasslands by xerophytic shrubs. Two critical limiting factors are herbivore conversion efficiency and herbivore selectivity. Forest is a sort of grazing operation which often leads to soil erosion and river silting. Shifting agriculture is most practiced in the tropics and involves interference with the rapid mineral cycling by the native vegetation, and quick depletion of soil minerals. Sedentary agriculture is mainly monocultural and decreases productivity but increases man's crop. (Casey-Arizona)

LIVESTOCK PRODUCTION IN THE SUBTROPICAL AND TROPICAL AFRICAN COUNTRIES,
Pretoria Univ. (South Africa). Dept. of Animal Science.
Jan C. Bonsma.
South African Journal of Science, Vol 66, No 5, p 169-172, May 1970. 4 ref.

Descriptors: Livestock, *Environmental effects, *Rainfall, *Tropical regions, *Productivity, Savannas, Semiarid climates, Phosphorus, Iron, Nitrogen, Calcium, Hydrogen ion concentration, Humid areas, Nutrients, Ecology, Growth rates, Management, Subtropic, Grasses.
Identifiers: *Hyperthermy, *Performance testing, *Adaptability.

The tropical and subtropical regions contain about 2/3 of the world's livestock numbers, but produce only about 10% of the world's edible livestock products. More attention must be given to the interaction between environment and animals, and this is illustrated by the differences between semiarid regions (savannas) and humid regions. In the low rainfall savannas, soil pH is usually near 7.0 and Ca, P and N levels are adequate. Most grasses are high in protein and palatable during winter months. In the humid regions, soil nutrients are leached out by the high rainfall and the grasses are highly fibrous with high heat increment values. Hyperthermy therefore becomes a critical problem and well adapted animals must be utilized. Small animals with high surface area/volume ratios dissipate heat more quickly. In all areas, the 2 most important measures of adaptability are fertility and weight gain. (Casey-Arizona)

NITROGEN IN AGRICULTURE: THE PROBLEMS AND THE EFFECT ON THE ENVIRONMENT,
Edinburgh Univ. (Scotland).
Stephen Watson.
Advancement of Science, Vol 27, No 131, p 25-37, Sept 1970. 5 fig, 5 tab, 15 ref.

Descriptors: *Nitrogen, *Water pollution effects, *Land management, *Environmental effects, *Fertilizers, Ammonia, Nitrates, Ureas, Nitrogen fixation, Crop response, Nitrogen fixing bacteria, Nitrogen cycle, Legumes, Grasses, Proteins, Soil microorganisms, Sewage, Farm wastes.

About 80% of the world's human population utilizes only 20% of the world's available protein. The problem is not one of redistribution but of increasing protein supplies. World supplies of fixed N are divided into 60 million tons in animals, 1000 million in plants and 150,000 million in the soil. To this, 100 million tons are annually added by biological fixation and 10 million by industrial fixation. The production of N by soil microorganisms and the utilization of N by plants are reviewed in detail. The problem of proper pasture mixtures between grasses and legumes in combination with controlled grazing is considered and the phenomenon of increased N fertilizer application to grasslands is described. Combinations of legumes and grasses result in improved pastures and soil fertility but the process is too slow to rule out N fertilizer applications in combination with appropriate water applications. Field drying is a brittle process which may result in great protein loss unless carefully managed, particularly because of the high cost of evaporating water. The problem of water pollution due to increased N fertilizer application and intensified cattle feeding is considered in detail. Such pollution may be considerable, but will not be of the same order as that due to biological fixation, town sewage and industrial wastes. (Casey-Arizona)

SEMIAUTOMATIC IRRIGATION.
Colorado State Univ., Fort Collins.

Colorado Farm and Home Research, Vol 19, No. July-Sept 1969, p 5, 1 fig.

Descriptors: *Irrigation systems, *Irrigation practices, *Irrigation efficiency, *Irrigation operation and maintenance, *Water management (Applied), Instrumentation, Timing, Automatic control, Crop production, Hay, Turf, Labor, Costs, Check structures, Diversion, Water utilization, Plant growth regulators, Soil-water-plant relationships.
Identifiers: *Intermittent irrigation.

A semiautomatic irrigation system is described consisting of a timer (cost $8.50), wire and lumber. Intermittent irrigation improves hay yields and composition. The semiautomatic system is designed to reduce labor costs for intermittent

gation. The system reduces labor time from a day
o 30 minutes. Drop-open or drop-close check
ates are set in series to operate at predetermined
tervals. Water may be diverted or permitted to
ow to fields. The 24-hour time can be set to 13
ates for 2-hour irrigations. Water-use efficiency
ill increase under this system. A photograph
ows an operator adjusting the timer. (Popkin-
rizona)

periment Station, Semi-arid lands.

op production is limited in Southeastern
olorado by an average annual rainfall of about 15
hes, average annual open-water-surface
aporation of about 78 inches, and variations in
aporation and rainfall distribution. High radia-
n and wind velocity, and low relative humidity
or evaporation. Conditions which affect soil-
ter-plant relationships were investigated at the
utheastern Colorado Branch Experiment Station
m 1956 to 1966 using a split-plot and subdivided
imeter. Treatments included fallowing, various
opping systems and fertilization; soil, plant and
ter sampled and analyzed. Grain sorghum
oduction was more stable than wheat. Wind
odibility, mechanical stability of soils, soil
emistry, and effects of continuous sorghum are
cussed. The areal soils are highly erodible re-
dless of cropping, fallowing, tillage or fertiliza-
n regime. Mechanical and chemical weed con-
l was satsifactory. Tables show effects of various
atments on soil properties, crop yields, and in-
ne generated. Data on precipitation and
poration are presented. (Popkin-Arizona)

kota, Corrosion control, Safety factors, Pumps,
omatic control, Depth, Nutrients, Leaching.
ntifiers: *Fertigation, Compressed air, Liquid
ilizer.

igation is the use of sprinkler irrigation systems
method of applying fertilizers. Nitrogen and
e elements may be applied this way, with nu-
ous types, methods and equipment. Pressure
ems are limited by injection method and
orm-application demands. A constant low
id volume is injected into the system according
method developed by the Agricultural Experi-
nt Station and Water Resources Institute at
th Dakota University. Compressed air is in-
ed into a liquid fertilizer tank, forcing the fertil-
izer through an orifice under constant head and minimum corrosion impact. A pivot maintains 75 pounds per square inch, and is controlled by a regular shop-type air compressor. Safety devices (check valves) operate if the compressor fails, and the pump continues, or the pump stops. The automated system was tested on a 140-acre lot, injecting 870 gallons of anhydrous ammonia in 70 hours. The safety features worked, and the method gave an accurate, economical fertilization. Advantages include slight labor costs, use on tall crops, good surface distribution and depth placement, availability of solution nutrients, ease of leaching, and lower fertilizer requirement. Figures show schematic of air injection fertigator, control system and connections, safety features, and use. (Popkin-Arizona)

Descriptors: *Cattle, *Benefits, *Crop production, *Return (Monetary), *Comparative productivity, Water conservation, Water utilization, Irrigated land, Pasture management, Forages, Grasses, Alfalfa, Bromegrass, Orchard grass, Hay, Corn (Field), South Dakota.
Identifiers: *Beef production, Belle Fourche Irrigation Project (South Dakota).

Irrigated pastures provide important forages for beef. Expected returns for irrigated pastures are compared with returns of other crops for a 1965-67 study in the Belle Fourche Irrigation Project (South Dakota). Irrigated pastures consisted of a mixed alfalfa, brome and orchard grass. Other crops were corn and hay. Corn, hay and irrigated-pasture returns on 500-pound steers were comparable, though irrigated crops were not shown to be superior to other crops. Four tables show average beef production, costs and returns on irrigated pasture, irrigated crop, irrigated alfalfa-brome and break-even returns from beef on irrigated pasture. (Popkin-Arizona)

Identifiers: *Panspots, *Solonetz soils, Containers.

Surface runoff, stored in ponds, is an economical water source on South Dakota livestock ranges. Range sites are of two types: panspots, on solonetz soils, where livestock find accumulated water; and sandy range sites, on normal coarse-to-fine sandy loams, where good forage production is possible. Two range site watersheds of 43 acres were investigated as experimental areas from 1962 to 1967. Confining dikes directed runoff to discharge-measurement flumes. Over 16 times as much livestock water came from panspots, where runoff occurred more frequently for the same precipitation. Seasonal variations, snow melt, and vegetative aspects are discussed. Water storage problems may be solved with ponding on panspot sites to reduce seepage. Watershed configuration controls runoff transmission and water loss. Livestock water needs may be met with ponding on heavy clay soils and with partially sealed containers. Six figures show a measuring flume, snow accumulation, and graphs of potential water supply, snowmelt and rainfall yield, and runoff variation. (Popkin-Arizona)

Runoff of rain water and uneven wetting of soil lead to irregular ripening of plants and to a decrease in crop yield. Runoff and low permeability of soils have an adverse effect on sprinkler effectiveness, since the position of a sprinkler must be changed when runoff begins. One of the means of reducing runoff, erosion and the uneven wetting of soil during sprinkler irrigation is to create small ridges on the soil surface at the time of sowing, inter-row cultivation, and water-supply irrigation of fall-plowed fields, and to use chisels on hayfields and pastures. Small machine-made ridges on the surface of a field and chiselling will make it possible to utilize sprinklers more effectively, prevent runoff and erosion, provide more uniform soil wetting, and contribute to higher crop yield. Identifiers: *USSR, Uzbek SSR, Samarkand Oblast, Irrigation erosion, Nutrient losses.

Studies conducted in the Payaryksiy Rayon of the Samarkand Oblast for irrigation-erosion control reveal a clear correlation between relief and irrigation water: the steeper the slope of an irrigation plot the more severe the irrigation erosion. In areas

with flat slopes (0.001-0.005) irrigation erosion is negligible regardless of the amount of irrigation water applied to a furrow. The extent of erosion and transport of soil particles beyond the area is 8-10 times less than in areas with steep slopes (0.01-0.05). Irrigation erosion leads to loss of humus, nitrogen, and phosphorus from the soil and to reduced soil fertility. Application of excess irrigation water results in loss of soil clay fractions, thereby contributing to coarser particle-size composition of the soils. To prevent slopes from exceeding 0.002-0.01, contour furrowing is needed to control erosion in areas with steep slopes. (Josefson-USGS)

Identifiers: Karakum Canal, USSR, Industrial development, USSR.

The V I Lenin Karakum Canal, 840-km long, carries the waters of the Amu Dar'ya River to Ashkhabad, the capital of Turkmen SSR. The Karakum Canal transports water to the dry regions of the Republic, the Murgab and Tedzhen Oases, the Kopet-Dag area, and western and southwestern regions. In its present state of completion, the canal provides irrigation for 240,000 ha of new lands. Of all the Union Republics, the area served has the sparsest water resources. Water was insufficient for irrigation, and centers of population did not have adequate supplies. Otherwise, conditions were favorable for agricultural development. In the Karakum Canal area, collective farms have been or are being set up and reclamation of new lands is being accomplished. On lands presently irrigated, reconstruction of irrigation systems is planned. The Regional Plan of Turkmen SSR shows that the cost of the V I Lenin Karakum Canal, taking into account expenditures for land improvement, organizing collective farms, and the outlay by the government for developing industry adapted to production on land irrigated from the canal, was fully returned to the government by 1964, and a profit of 615 million rubles was produced by 1969. Identifiers: *Soil Conservation Service, Cobb-Douglas, Missouri.

An economic model is developed for analysis of investments in irrigation. The model encompasses the associated problem of temporal allocation of limited irrigation water within the growing season of a single crop. The problem is placed in the framework of stochastic dynamic programming, and it is shown how the algebraic form of the production function for the crop determines the appropriate state variables of the decision process. An application of the model is made to conditions prevalent in central Missouri with corn the irrigated crop. (Holmes-Rutgers)

This issue of the serial publication, which contains 16 papers, discusses the results of formulating methods for forecasting some of the characteristics of spring runoff from rivers of the Dnieper and Dniester basins and of rain floods on rivers of Transcarpathia. Studies of snowmelt characteristics and the infiltration capacity of soils during summer at the Boguslav Experimental Station are examined. A number of articles are concerned with computations involving the transformation of water movement in river channels, determination of the ordinates of spring runoff hydrographs, computations of water resources and the water balance of individual river basins, and determination of minimum discharges for Ukrainian rivers. A device for computing runoff on agricultural fields is described. (See also W71-08375 thru W71-08390) (Josefson-USGS)

A method is suggested for computing and forecas ing water flow to he Kiev reservoir during a hig water period, taking into account characteristics spring runoff formation on the Dnieper, Sozh an Pripyat' River basins. Basin water storage befo start of spring snow thaw was determined from regular snow accumlation in the forest and fie and evaporation from the surface of basins duri time of snow melt. An analysis of the formation melt water losses in highly waterlogged, forest areas and expanses with a shallow water tab showed that the soil moisture content of the basin of primary importance in determining amount meltwater loss. Prespring wetting of the upp meter layer of soil was used to describe wat permeability of the soils in the Dnieper and Pripy basins and water storage in a frozen soil layer to dicate water permeability of soils in the Sozh bas Relationships were derived for melt water a function of total maximum snow storage a precipitation during snowmelt and water perme bility of the soils for the three areas studied. Identifiers: *Ukraine, Dnieper River, Sozh Ri Pripyat' River.

A method is proposed for forecasting maxim discharge of water flow into the Kiev reserv based on a discrete account of hydrometeorol cal characteristics of three partial basins. Altho the relationships between maximum w discharges and total spring runoff hydrometeorological factors are quite close, additonal variable describing the change in mospheric circulation during the second half of year is introduced to increase accuracy forecasts. The variable used is the sign of the ference between the indices of atmospheric ci lation during February and the half-sum December and January. It is concluded that ratio of peak flow to basin yield during high-w formation in the Dnieper River basin has a siderable effect on the height of high water, ticularly during years of inadequate soil mois and low rate of snowmelt. Special studies required of hydrologists and weather forecas for working out a method for predicting peak during formation of high water. (See also W 08374) (Josefson-USGS)

fall-runoff conditions are described for the athian River Latoritsa near Mukachev. The area is 1,380 sq km. An empirical relation-s established between the runoff depth of in-ual floods and precipitation over a computed interval and the moisture content of the soils. nbination of three values was used to describe oisture content: the river preflood discharge d by groundwater, precipitation during lag of num base flow, and air temperature during a f rainfall. Recommendations for determining dwater values are based on the use of the onship of surface and groundwater maxima typical base flow recession curve. A system parating complex floods into individual floods cans of two typical recession curves--surface and groundwater-- is proposed. A forecast of num discharges of floods is based on the rela-ip of the volumes of runoff of individual to their maximum discharges. The forecast od developed insures an accuracy satisfactory eparing forecasts ten hours in advance. (See 71-08374) (Josefson-USGS)

S OF MELT WATER FLOW ALONG ES (RUSSIAN: O SKOROSTYAKH ANIYA TALOY VODY PO SKLONAM),
Deleur.
Voprosy gidrologicheskikh prognozov i tov, Ukrainskiy Nauchno-Issledovatel'skiy meteorologicheskiy Institut Trudy, No 76, p , 1969. 3 fig, 9 ref.

iptors: *Flow rates, *Melt water, *Slopes, r yield, Snowmelt, Ice, Ice-water interfaces, cover, Discharge (Water).
iers: *Ukraine, Slope characteristics, Snow e, Ice crust.

Experimental studies conducted in 1967 at the Boguslav Experimental Hydrologic Field Station in the Dovzhik basin have established a relationship between rates of melt-water flow under snow and the rate of water yield from snow, the surface slope, height of snow in the area of observations and slope roughness. The rate of melt-water flow along slopes varies between 0.23 and 7.5 mm/sec. Flow rates under snow for an ice crust in areas with 9-13 deg slopes average half those in areas with 21-22 deg slopes when water yield rate and height of snow are equal. Given an equal rate of water yield from snow, flow rates along an ice crust are 1.5-3.5 (and occasionally 5) times less when average height of snow is 25-35 cm than when snow heights are 15-20 cm. Flow rates for melt water vary between 0.2 and 7.5 mm/sec when a compact ice crust is present on the soil surface. Given an equal rate of water yield, flow rates for a loose ice crust range from 0.5 to 4.0 mm/sec, which is almost 2-2.5 times less than the rate for a compact crust. The flow rate under snow for ice crust-free soil varies between 2 and 6 mm/sec. Flow rates in an open river course during an initial period of thaw are 10-50 mm/sec and in succeeding periods 200-500 mm/sec. Maximum flow rate in a stream was observed to be 1.25 m/sec. Flow rate in open river courses was examined as a function of their water discharges. However, deviations in the values of flow rates from the line of the relationship averaged plus or minus 15%, which was explained by a failure to take into account the effect of surface slopes. (See also W71-08374) (Josefson-USGS).

PRICIPLES FOR CONSTRUCTING HIGH-WATER HYDROGRAPHS (RUSSIAN: METODICHESKIYE OSNOVY POSTROYENIYA GIDROGRAFOV VYSOKIKH POLOVODIY),
V. I. Moklyak, and P. A. Shkryabiy.
In: Voprosy gidrologicheskikh prognozov i raschetov, Ukrainskiy Nauchno-Issledovatel' skiy Gidrometeorologicheskiy Institut Trudy, No 76, p 71-79, 1969. 2 fig, 3 tab, 5 ref.

Descriptors: *Hydrographs, *Statistical methods, *Probability, *Discharge (Water), *Water balance, Inflow, Melt water, Runoff, Surface runoff, Channel flow, Hydrologic data, Equations, Peak discharge.
Identifiers: *Ukraine, Sozh River, Distribution curves, Balance method.

A statistical genetic method for determining spring high-water discharges, including maximum discharge, equivalent to the total depth of runoff, is examined. Computations are performed by means of water balance equations based on daily layers of flow into a channel network of given excess probability, established from statistical processing of daily layers of flow for previous years. The results of computations make it possible to determine maximum discharges of very low excess probability (less than 1%) and thus refine the distribution curve of excess probabilities of maximum discharges, which in this zone is not usually based on observation data. The computed maximum discharges within the zone of very low excess probabilities are often below the discharges determined by the three-parameter gamma distribution curve, whose parameters have been computed from long-term annual maximum discharge values for melt water. To illustrate the computation method proposed, hydrograph discharges and maximum discharges of the Sozh River near Gomel' with an excess probability of 1.0, 0.1 and 0.01% are used. W71-08381

DETERMINING UNIT INFLOW OF MELT WATERS FROM A BASIN BY A UNIT HYDROGRAPH (RUSSIAN: OPREDELENIYE ELEMENTARNOGO PRITOKA TALYKH VOD S BASSEYNA PO YEDINICHNOMU GIDROGRAFUL),
Ya. A. Fomenko.
In: Voprosy gidrologicheskikh prognozov raschetov, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 76, p 80-85, 1969. 2 fig, 1 tab, 9 ref.

Descriptors: *Unit hydrographs, *Melt water, *Inflow, *Discharge (Water), Runoff, Time lag, River flow, Water yield, Recession curves.
Identifiers: *Ukraine, Desna River, Channel storage, Lag coefficients.

A genetic method for computing the transforming effect of a channel capacity on inflow into a river network from a basin during formation of high waters is examined. Computation of unit inflow by means of retransformation of observed discharges of runoff hydrographs is based on construction of a hydrograph from refined genetic runoff formulas and on a theoretical method of determining a unit hydrograph by lag coefficients. Ordinates of a unit hydrograph are computed on the basis of a chart of basin unit widths and a chart of basin widths constructed from the maximum rate of lag of a flood wave. Used in the computations are ratios between maximum velocity of wave frontal movement and average velocity by river length and between the volumes of channel storage and their corresponding discharges. Lag coefficients are computed from formulas which take into account the most probable structure of river flow, determined by roughness and shape of the channel course and the river floodplain. Unit inflow of melt waters from the Desna River basin to Bryansk during a 1931 high-water period is used as an example of computation. Maximum daily unit inflow is determined two days before maximum discharge of high water and equals 31.8 mm/day, which amounts to 1.82 of the maximum runoff depth (17.5 mm/day) and 0.20 of the total runoff depth (162 mm) for 16 days of intensive inflow of melt waters from the basin into the river network. The unit hydrograph method is recommended for use in determining daily rate of inflow and for analyzing typical shapes for unit inflow charts. (See also W71-08374) (Josefson-USGS)

STUDY OF THE RELATIONSHIP OF A RUNOFF COEFFICIENT TO HYDROGRAPHIC CHARACTERISTICS OF A RIVER AND LAG TIME OF A FLOOD WAVE (RUSSIAN: ISSLEDOVANIYE ZAVISIMOSTI KOEFFITSIENTA OTTOKA OT GIDROGRAFICHESKIKH KHARAKTERISTIK REKI I VREMENI DOBEGANIYA PAVODOCHNOY VOLNY),
Ya. A. Fomenko.
In: Voprosy gidrologicheskikh prognozoy i raschetov, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 76, p 86-91, 1969. 3 fig, 14 ref.

Descriptors: *Runoff coefficient, *Channel morphology, *Floods, *Time lag, Chezy equation, Mannings equation, Roughness (Hydraulic), Hydraulic properties, Flow, Watersheds (Basins).
Identifiers: *Ukraine, Dnieper River, Southern Bug River, Severskiy Donets River, Azov Sea.

Although the relationship of the runoff coefficient to a basin area or river length has not been adequately expressed, it can, in individual homogeneous geomorphological regions, be more specific when taking into account a stream gradient. A stream gradient is dependent upon the geomorphological characteristics of a channel and, to a certain extent, determines the capacity of channel storage and lag time of a flood wave. By taking into account the extent of forested areas and the waterlogged state of a basin, a clearer relationship can be derived between coefficients of runoff and causative factors. The runoff coefficients, as a function of lag time, are determined graphically by the relationship between observed discharges of consecutive days at time of recession of high waters for 160 sites and the runoff from rivers of the Dnieper, Southern Bug, Severskiy Donets and Azov Sea basins. It is suggested that lag time be computed from average lag velocity according to

the Chezy-Mamming formula, which takes into account the shape and roughness of a channel and flood-plain, stream gradient and magnitude of maximum discharge. (See also W71-08374) (Josefson-USGS)

FIELD STUDIES OF THE INFILTRATION CAPACITY OF SOILS (RUSSIAN: O POLEVYKH ISSLEDOVANIYAKH VPITYVAYUSHCHEY SPOSOBNOSTI POCHVOGRUNTOV),
N. G. Galushchenko.
In: Voprosy gidrologicheskikh prognozovi raschetov, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 76; p 92-98, 1969. 2 fig, 8 ref.

Descriptors: *Infiltrometers, *Infiltration, *Artificial precipitation, *Sprinkler irrigation, *Soils, Watersheds (Basins), Topography, On-site investigations, Ravines, Forests, Permeability, Runoff.
Identifiers: *Ukraine, Artificial sprinkling, Infiltration rate.

Experimental field studies of the infiltration capacity of soils on forested and field sections of the Boguslav Hydrologic Field Station were conducted by means of artificial sprinkling and flooded plots (infiltrometers). In a basin west of Boguslav, infiltrometers yielded values too high as compared with sprinkled plots. In forested areas the ratios obtained from infiltrometers during initial periods were usually 5-10 times those obtained by sprinkling methods and, in individual cases, 60-100. In open areas the difference was less and did not exceed 7-45. The difference in infiltration values from readings of flooded plots and artificial sprinkling decreased with time, amounting to 2-5 in the forest after 30-40 minutes and 2 in field areas. Readings of infiltrometers and sprinkled plots differed with respect to total depth of absorbed water and the time required for a steady infiltration value. Depending upon the sprinkling rate and its duration, the depth of absorbed water in forested areas was 2-10 times less from artificial sprinkling than from infiltrometers; in open areas the ratio was considerably less and in individual instances was equal to unity. In forested areas a relatively steady infiltration value during sprinkling was established 3-6 times more rapidly than in infiltrometers and in open areas the ratio of these time intervals did not exceed 2. An appreciable difference (10-11-fold) in infiltration values was also observed at the end of the third hour of experiments, using the two methods described. (See also W71-08374) (Josefson-USGS)

DETERMINING PARAMETERS OF A UNIT HYDROGRAPH (RUSSIAN: K OPREDELENIYU PARAMETROV ELEMENTARNOGO GIDROGRAFA),
T. A. Chekushkina.
In: Voprosy gidrologicheskikh prognozov i raschetov, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 76; p 99-106, 1969. 2 fig, 3 tab, 5 ref.

Descriptors: *Unit hydrographs, *Discharge (Water), *Watersheds (Basins), *Time lag, Channel flow, Channel morphology, Chezy equation, Mannings equation, Roughness (Hydraulic), Geomorphology.
Identifiers: *Ukraine, Sozh River, Ingul River, Berezina River, Isochrones, Travel time, Moklyak curve.

Discharges of a high-water hydrograph can be quite accurately computed by using a unit hydrograph whose ordinates must be based on an accurate determination of the number of isochrones in a basin and the initial lag coefficients between isochrones. The value of the initial lag coefficient between isochrones for each specific basin may be assumed to be constant for a number of years of high water, since the pattern of increased discharges and drainage of a basin varies little under specific geomorphological conditions with minor fluctuations in high-water content. Ordinates of a unit hydrograph vary with change in lag time, which depends upon the magnitude of maximum discharge and redistribution of the coefficients of basin width. In similar-size basins such as the Ingul River basin near Novogorozheno and the Berezina near Borisov, channel flow may be variously formed, which calls for a careful approach to the problem of selecting initial lag coefficients as a function of the physico-geographic conditions of a basin. In constructing a unit hydrograph for partially waterlogged basins it may be necessary to assume variables of the initial lag coefficients for reaches between isochrones in order to accurately account for the transformation characteristics of discharges for individual reaches of a river. COMPUTING DISCHARGES OF HIGH WATER FROM PARTIAL BASINS BY UNIT HYDROGRAPHS (RUSSIAN: O VYCHISLENII RASKHODOV POLOVOD'YA PO ELEMENTARNYM GIDROGRAFAM S CHASTNYKH BASSEYNOV),
T. A. Chekushkina.
In: Voprosy gidrologicheskikh prognozov i raschetov, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 76; p 107-111, 1969. 2 fig, 2 tab, 11 ref.

Descriptors: *Discharge (Water), *Unit hydrographs, *Watersheds (Basins), Time lag, Reservoirs, Chezy equation, Mannings equation, Roughness (Hydraulic).
Identifiers: *Ukraine, Seym River, Travel time, Lag coefficients.

A possibility of obtaining high-water discharge values at a discharge site as a sum of individual hydrographs of partial basins is examined. To derive daily discharges, a unit hydrograph method is used in distributing lag coefficients along a model lag curve. The computation method cited yields satisfactory results and can be used to resolve problems associated with the separation of a basin into parts, particularly in studying the regulating effect of reservoirs in a basin on discharges at a site. For computation purposes, the Seym River basin, covering an area of 25,600 sq km, was used to compute discharge. A comparison of computation results showed that a total hydrograph derived by the summation of discharges from two partial basins was somewhat closer to a recorded hydrograph than a hydrograph determined for an entire basin as a whole. Future investigations will be directed at resolving the problem by dividing a whole basin into several sub-basins. (See also W71-08374) (Josefson-USGS)

In: Voprosy gidrologicheskikh prognozov i raschetov, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 76; p112-115, 1969. 2 fig, 3 ref.

Descriptors: *Flowmeters, *Discharge measurement, *Crops, *Rotations, Instrumentation, Irrigation, Agriculture.
Identifiers: *Ukraine, Dnepropetrovsk oblast, Crop rotation fields.

Because of their simplicity and convenience and the fact that they do not interfere with agricultural work, a flowmeter or device for partial volumetric measurement of water discharge and runoff from crop rotation fields is recommended. Laboratory and on-site tests along with two years of experience in the use of a number of flowmeters on irrigation fields have revealed that flowmeters are reliable even the lowest gradients, are relatively unaffect by silt and insure a water discharge measureme accuracy of plus or minus 3%. Runoff plots of 20 25 m equipped with flowmeters consisting of a tu 20-cm high and 10-cm wide, designed to pen discharges up to 20 liter/sec, have been in use the Sofiyevka Rayon of the Dnepropetrovsk Ob since 1965. Experience has shown that the dev and operation of these plots are more expedi than hitherto used equipment. (See also W 08374) (Josefson-USGS)

WATER RESOURCES AND WATER BALAN OF THE UKRAINE AND MOLDAVIA (R SIAN: VODNYYE RESURSY I BALANS V UKRAINY I MOLDAVII),
L. G. Onufriyenko.
In: Voprosy gidrologicheskikh prognoz raschetov, Ukrainskiy Nauchno-Issledovatel' Gidrometeorologicheskiy Institut Trudy, No 7 116-130, 1969. 5 fig, 6 tab, 13 ref.

Descriptors: *Water balance, *Water resour *Water consumption, *Runoff forecasting, *R basins, Moisture content, Runoff coefficient, noff, Precipitation (Atmospheric), Evapora Watersheds (Basins), Meteorological data.
Identifiers: *Ukraine, *Moldavia, Desna R Tissa River, Dnieper River, Dniester River, Se skiy Donets River, Southern Bug River.

New runoff data computed from cyclic varia in water content and from the influenc economic activity on runoff were used to study resources and water balance of river basins o Ukraine and Moldavia and of individual phy geographic zones. Resources were computc connection with requirements for finding met of preparing water balances for an average and for low-water years of 75 and 95% probab Local runoff for the Ukraine for an average was 50.251 cu km and runoff entering the Uk from other republics 34.748 cu km; for Mol runoff values for an average year were 0.670 9.985 cu km, respectively. Precipitation, r and evaporation values for the Ukraine were mm, 83 mm and 526 mm, respectively; for davia these values were 517 mm, 20 mm and mm. Water resources of the Ukraine represent about 1.2% of the total figure for the Soviet U and those of Moldavia only 1%, which fo average year equals 4,358 cu km. Projecting a only the Desna and Tissa Rivers and their tri ries appear able to satisfy fully future water sumption needs. The water resources o Dnieper and its tributaries--the Ros', Sula, Pse Vorskla--and of the Western Bug, Seret and rivers, while meeting annual water needs providing sanitary disposal, fail to satisfy max seasonal requirements. The Dniester, Sev Donets, Mius, Kal'mius, Southern Bug and Rivers and rivers of the Crimea meet neith nual nor peak season demands. (See also 08374) (Josefson-USGS)
W71-08388

FLUCTUATIONS IN MINIMUM RUNOFF RIVERS OF THE UKRAINE (RUS KOLEBANIYA MINIMAL'NOGO STOKA UKRAINY),
K. A. Lysenko.
In: Voprosy gidrologicheskikh prog raschetov, Ukrainskiy Nauchno-Issledovat Gidrometeorologicheskiy Institut Trudy, No 131-135, 1969. 1 fig 1 tab, 9 ref.

Descriptors: *Runoff forecasting, *Low flow face-groundwater relationships, *Hydrologic Precipitation (Atmospheric), Rivers, Sta methods.
Identifiers: *Ukrainian rivers, Cyclic vari Low-water periods, High-water periods.

In drawing up recommendations for con minimum runoff for rivers of the Ukraine f

ns in minimum runoff were studied for determin- maximum low-water periods within which vest minimum runoff values are possible. nimum discharges on small Ukrainian rivers are rmed mainly by the inflow of groundwaters ose magnitude and yield are determined by at- spheric precipitation and other physico-geo- aphic factors. The greatest number of observa- ns of minimum runoff in the Ukraine were con- cted on the Desna, Severskiy Donets and Dni- er Rivers for a period of 65-69 years and on the r', Tur'ya, Uzh, Sula, Southern Bug and Rov ers for 40-50 years. Integral curves of fluctua- ns in minimum runoff for the Desna, Severskiy nets and Dniester Rivers revealed a successive periodic alternation of high-water and low- er periods (half cycles) of varied duration rang- from 8 to 46 years. Average water content for ividual cycles for the period 1940-1962 iated little from the average long-term value (by % and only in individual instances by as much as 14%). Long term changes in groundwater level e subjected to cyclic fluctuations wherein a chronism in the fluctuations of minimum charges of rivers and of groundwaters forming m could be seen. Study of long-term fluctua- s in minimum runoff makes it possible to deter- e the maximum low-water period characteristic ivers of a specific zone and to identify in this od the years which will have a rare recurrence inimum runoff. reliability of simplified computations of the ement of flood waves using the Kalinin-Milyu- method can be substantially increased if ad- d values of runoff for typical reaches are ated by computations for design reaches. Such bstitution is particularly desirable when lag within a typical reach is more than the design interval. Computations of water movement for hes whose length has been determined by harges within the entire range of their changes the observance of the condition 'delta t is ap- imately equal to lag time' permit computations e performed with a maximum possible accuracy simplified computations, and insure coin- nce in time and magnitude of maximum and mum water discharges. It would be inadvisable erform computations when delta t is much less lag time, since a computation for small design intervals with a relatively smooth change in harges, while increasing volume of computa- , does not increase their reliability. One may ne delta t to be much more than lag time only the design interval describes in sufficient l the rate of discharges during a flood period. from field observations of the movement of d waves downstream from the dam of the Ivan'- kaya Hydroelectric Powerplant in August were used as a basis for computations. DEVELOPMENT OF WATER RESOURCES IN THE KHMER REPUBLIC.
Economic Commission for Asia and the Far East, New York.

Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ST/ECAFE/SER. C/87), p 1-44, Dec 1970. 44 p, 10 fig, 12 tab, 9 ref.

Descriptors: *Water resources development, *Planning, *River basin development, Deltas, Rivers, Water supply, Water management (Applied), Monsoons, Flood control, Dams, Reservoirs, Hydroelectric power, Irrigation water.
Identifiers: *Khmer Republic, *Indochinese Peninsula.

The Khmer Republic is situated in the southwestern corner of the Indochinese peninsula. The dominant geographical feature is the Mekong river which plunges over the Khone Falls at the border with Laos and courses through many rapids between the town of Khone and Kratie before gradually becoming wider and less turbulent and flowing in a generally southerly direction through the eastern part of the central Khmer plain. South of Phnom Penh, the capital, it splits into two branches, the eastern branch continuing to be known as the Mekong, while the western branch is named the Bassac river. It is estimated that as many as 4 million people, or more than 60% of the total population, do not have access to piped water supplies. The development of the water resources of the Khmer Republic cannot be separated from the comprehensive development of the entire lower Mekong basin, which is being implemented under the Mekong project. A brief description is given of the status of the major mainstream and tributary projects in the Khmer Republic under the Mekong Indicative Basin Plan. (Knapp-USGS)

EFFECT OF LAND USE ON THE HYDROLOGY OF SMALL WATERSHEDS IN SOUTHWESTERN WISCONSIN,
North Central Forest Experiment Station, La Crosse, Wis.
Richard S. Sartz.
Symposium on the Results of Research on Representative and Experimental Basins, Wellington, New Zealand, December 1-8, 1970. Publication No 96, International Association of Scientific Hydrology, p 286-295.

Descriptors: *Storm structure, *Rainfall disposition, *Small watersheds, *Sediment yield, Agricultural watersheds, Forestry, Unit hydrographs, Land use, Wisconsin, Overland flow, Storm runoff.
Identifiers: Experimental watersheds.

Overland flow and sediment discharge were measured on small single land use watersheds and natural runoff plots in southwestern Wisconsin's unglaciated region. Forest watersheds produced overland flow only after heavy rains, and the amounts of flow and peak rates were low compared with those from open-land watersheds. Peak flow rates from a major storm ranged from 64 millimeters per hour for tilled land to no flow for undisturbed forest. Analysis of the flows from five large storms in 1 year showed that peak rates from tilled land averaged 2.5 times those from meadow, and peak rates from meadow 1.4 times those from an abandoned field. Peak rates from heavily grazed pasture were 3.0 times those from lightly grazed pasture. Suspended sediment content of the runoff water ranged from 238,000 parts per million for tilled land to 0 parts per million for undisturbed forest. Sediment content was low for forest, abandoned field, and meadow, but high for tilled land and heavily grazed pasture.

WATER RESOURCES DEVELOPMENT BY THE U.S. ARMY CORPS OF ENGINEERS IN NEW YORK.
Corps of Engineers, New York. North Atlantic Div.

Army Corps of Engineers Water Resources Development Report, Jan 1971. 153 p.

Descriptors: *Water resources development, *New York, *Engineering structures, Surface waters, Navigation, Navigable waters, Bridges, Flood control, Reservoirs, Beach erosion, Dams, Hurricanes, St Lawrence Seaway, Sedimentation.
Identifiers: Niagra River, Niagra Falls.

This report provides current information on the scope and progress of water resources development within the State of New York by the United States Army Corps of Engineers. It describes briefly the Corps' role in planning and building these improvements and includes an explanation of the procedure for initiating and processing them. Information is given on the status of the various projects, whether the work is completed, is underway, or has not been started. The projects are concerned with navigation, alteration of bridges over navigable waterways, flood control, reservoirs, lakes, beach erosion, hurricane protection, St. Lawrence Seaway, and Niagra remedial works. GENERAL HYDRAULIC SYSTEM MODEL,
Illinois Univ., Urbana. Dept. of Hydraulic Engineering; and Madras Univ., India College of Engineering.
Ven Te Chow, and V. C. Kulandaiswamy.
ASCE Proceedings, Journal of the Hydraulic Division, Vol 97, No HY6, Paper 8176, p 791-804, June 1971. 14 p, 4 fig, 1 tab, 8 ref, append.

Descriptors: *Simulation analysis, *Mathematical models, *Numerical analysis, *Systems analysis, *Flood forecasting, Streamflow forecasting, Model studies, Routing, Input-output analysis, Peak discharge, Runoff, Storm runoff, Unit hydrographs, Hydrograph analysis, Design storm, Design flow, Design flood.
Identifiers: Hydrologic models, Hydrograph synthesis.

A lumped, deterministic, nonlinear mathematical model is developed and proposed for the simulation of hydrologic systems. The model is developed from expansion of a general storage function of input and output in Taylor's series about a steady state. The model recommended for practical application is based on the system model in the form of a third-order differential equation. It is a quasi-nonlinear model because the coefficients of the differential equation are considered as functions of the peak discharge of direct runoff. In the analysis of the model, watershed is taken as the hydrologic system. Nine watersheds with more than 70 major and minor storms were used in the analysis and verification of the recommended model. The

results indicate a very satisfactory simulation of watershed hydrologic systems by the model. (K-napp-USGS)

FLOOD PLAIN INFORMATION-WEST BRANCH BRANDYWINE CREEK.
Corps of Engineers, Philadelphia, Pa.

Army Corps of Engineers Flood Plain Report, Mar 1970. 48 p, 5 fig, 16 plate, 9 tab.

Descriptors: *Floods, *Flood damage, *Pennsylvania, Flood plains, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: *West Branch Brandywine Creek, *Chester County (Penn), Standard project flood, Intermediate regional flood.

Flooding along the West Branch Brandywine Creek from the junction of the East and West Branches in the southeast portion of Chester County upstream to the northern limits of the City of Coatesville, Pennsylvania is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. Flood stages can rise from normal flow to extreme peaks in a relatively short period of time. During the flood of August 9, 1942 the West Branch Brandywine Creek in the Coatesville area had a maximum rate of rise of 7 feet per hour and remained out of banks for about 9 hours. During a Standard Project Flood at the same location, the stream would rise 18 feet in 10 hours and would remain out of banks for about 30 hours. (Woodard-USGS)

FLOOD CONTROL STUDY OF RIO GRANDE DE MANATI, MANATI AND BARCELONETA, PUERTO RICO.
Flavio Acaron and Associates, San Juan (Puerto Rico).

Available from the National Technical Information Service as PB-196 488, $3.00 in paper copy, $0.95 in microfiche. Flavio Acaron and Associates Consulting Engineers Flood Control Report, June 1970. 123 p, 43 exh, 42 tab, 15 ref.

Descriptors: *Flood control, *Flood protection, *Flood damage, *Flood plains, *Puerto Rico, Regional flood, Flood forecasting, Watershed management, Levees, Flood forecasting, Watershed management, Levees, Flood routing, Hurricanes, Streamflow, Runoff, Channel improvement.

Flooding along the Rio Grande de Manati watershed in Puerto Rico is described to aid in solving flood control problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections and other material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The principal cause of major flooding has been the passage of hurricanes and of tropical disturbances over or near the island of Puerto Rico; however, in some occasions concentrated abnormal rainfall has caused flood stages that have been equal to or greater than those generated by rainfall during the passage of hurricanes and of tropical disturbances. To achieve an effective flood control plan, several structures and measures are described. (Woodard-USGS)

THE RUNOFF REGIME DURING SUBSURFACE DRAINAGE OF PEAT BOGS (RUSSIAN: REZHIM STOKA PRI OSUSHENII TORFYANIKOV ZAKRYTYM DRENAZHEM),
Vsesoyuznyi Nauchno-Issledovatelskii Institut Gidrotekhniki i Melioratsii, Moscow (USSR).
V Ya. Chernenok.
Gidrotekhnika i Melioratsiya, No 1, p 66-69, January 1971. 4 p, 2 fig, 3 tab.

Descriptors: *Runoff, *Subsurface drainage, *Subsurface drains, *Bogs, *Drainage effects, Soils, Discharge (Water), Seasonal, Precipitation (Atmospheric), Porbability.
Identifiers: *USSR, Peat bogs, Water regime, Growing season, Bog drainage.

Studies conducted in 1961-69 on the Yakhroma River floodplain have established that maximum discharges of 10% probability during subsurface drainage of peat bogs with drains at a depth of 1.7-2.0 m and spaced 20 and 40 m apart were 0.66 and 0.58 liter/sec/ha: maximum discharges during the presowing season were 0.45 and 0.44 liter/sec/ha, respectively. Maximum discharges of 10% probability during subsurface drainage with drains at depths of 0.8-1.2 m and spaced 20 and 40 m apart were 0.81 and 0.79 liter/sec/ha, with maximum discharges during the presowing season 0.56 and 0.67 liter/sec/ha, respectively. Average monthly discharges for the May-September periods from 1962-69 during subsurface deainage of peat bogs did not exceed 0.2 liter/sec/ha. A maximum discharge of 1.64 liter/sec/ha was observed in June 1965 in an area of intense precipitation (56.3 mm), where drains had been placed to depths of 0.8-1.2 m and set 20 m apart. Macimum discharges of 1-10% probability during subsurface drainage to depths of 1.7-2.0 m with drains 20 and 40 m apart were 24-27% lower than values obtained from installing drains to a depth of 0.8-1.2 m. NOTE ON HYDROLOGICAL RESEARCH IN BOTSWANA WITH SPECIAL EMPHASIS ON RESEARCH IN THE HYDROGEOLOGICAL FIELD,
Botswana Geological Survey, Lobatse.
C. M. H. Jennings.
South African Journal of Science, Vol 67, No 1, p 12-21, Jan 1971. 1 fig, 13 ref.

Descriptors: *Hydrogeology, *Groundwater basins, *Boreholes, *Semiarid climates, *Subsurface investigations, On-site investigations, Drainage basins, Climatic data, United Nations, Aquifers.
Identifiers: *Botswana, *Kalahari Desert.

Botswana, located in southern Africa, is a vast semiarid tableland with erratic rainfall. A few rivers in the north are perennial, but most drainages are ephemeral. Arable soils suitable for irrigation are too far from the northern area waters to allow for economical pumping schemes. The agricultural potential of the nation is therefore limited, and the major industry is cattle raising. Both cattle and men are dependent upon groundwater supplies that are rapidly becoming depleted. Mineral finds have been made, indicating the potential of a mining industry if water supplies are adequate. A great de of hydrogeological research has been carried out recent years and observation boreholes have bee developed. Borehole water level measuremen combined with data on rainfall and groundwat consumption have yielded information on sa yields, infiltration rates, transmissibility and stora capacity. C-14 and stable isotope studies in certa Kalahari ranching areas should yield data on a and origin of groundwaters as well as aquif characteristics. (Casey-Arizona)

charge in permeable hardland soils of the High
ins of Texas is negligible, and the Ogallala
ifer is cut off from any other appreciable water
rce. The relief of the hardlands is characterized
numerous playas or depressions in which most
rm runoff collects. The playa bottoms are
ally blanketed with clay, which retards
nward percolation. Between 1.8 and 5.7 mil-
acre-feet annually are wasted by evaporation
m playas. A site 600 feet from a playa at Bushland, Texas, was used for basin recharge tests. Two 66-foot square basins with 1:1 side slopes were excavated to expose the unconsolidated caliche layer approximately 4 feet below ground surface. Neutron moisture meter access tubes and several piezometers were installed. Playa water containing suspended solids was applied. Percolation rates rose until 0.92 pound of sediment per square foot of basin was added. Suspended solids definitely reduced percolation rates, but zooplankton may have had an equally important influence. The main advantage of basin recharge is the relative low cost and ease of sediment removal should it be necessary. (See also W71-08349 thru W71-08357) (Knapp-USGS)

PROBLEMS OF ARTIFICALLY RECHARGING THE OGALLALA FORMATION IN COLORADO,
Geological Survey, Denver, Colo.
C. T. Jenkins, and W. E. Hofstra.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 154-164, 1970. 11 p, 5 fig, 5 ref.

Descriptors: *Artificial recharge, *Colorado, *Aquifers, *Alluvium, Infiltration, Alluvial channels, Water spreading, Permeability, Transmissivity, On-site tests, Rainfall, Water supply, Playas, Water conservation, Water reuse, Hydrogeology.
Identifiers: *Ogallala aquifer (Colorado).

Two studies relating to artificial recharge were made by the U. S. Geological Survey in the northern High Plains of Colorado in 1969. The studies consisted of an evaluation of water available in Kit Carson County, Colorado, and test drilling near Akron, Colorado. Less than 1 percent of the average annual precipitation, which is about 16 inches, leaves the area as surface runoff. This limited amount of water available for increasing recharge probably precludes the construction of large recharge projects. However, the study indicated that significant natural recharge occurs in some ephemeral stream channels. The test-drilling study showed that many poorly permeable lenses within the Ogallala Formation inhibit recharge. Some water might be salvaged from playas either by pumping the water for reuse onto cropped land or by recharging it to the aquifer through wells. (See also W71-08349 thru W71-08357) (Knapp-USGS)

Identifiers: *Styria (Austria), *Austria.

In the tertiary basin of Styria and southern Burgenland, 287 flowing and 51 non-flowing artesian wells produce water which largely runs off unused. The 287 flowing wells yield about 3280 cu m per day. From these, a population of 1550 and their irrigated farms are supplied. Daily consumption is about 110 liters per person. The balance of 3,116,000 liters per day runs off unused, which means that 5% is actually consumed and 95% is wasted. It is possible that the limits of safe yield have already been overstepped. According to the Austrial Water Law of 1959 artesian wells must be reported to, and approved by, the authorities, but the law contains no definition of the term 'artesian well'. (Knapp-USGS).

The television camera has become a tool of the groundwater geologist, enabling him to examine visually the inside of a well deep below the land surface. Using the camera, the rocks can be viewed in place. Of great importance to the groundwater studies in coastal Georgia, the camera enables the geologist to see the important water-bearing zones in a limestone aquifer, and to recognize cracks and solution cavities, the changes in geologic formations, and the irregularities in the well bore that indicate the relative hardness of the rocks. The engineer, well driller, and water developer can examine a well when 'trouble shooting' to see whether the casing is broken, whether screens are eroded, or whether the well contains obstructions. VOLUME OF SNOWMELT INTERCEPTED BY LOGGING ROADS,
Southern Forest Experiment Station, Oxford, Miss.
Edward R. Burroughs, Jr., Michael A. Marsden, and Harold F. Haupt.
ASCE National Water Resources Engineering Meeting, Phoenix, Arizona, Jan 11-15, 1971. Preprint 1326. 23 p.

Descriptors: *Snowpacks, *Snowmelt, *Runoff, *Lumbering, Overland flow, Interception, Mountains, Watersheds (Basins), Melt water, Snow management, Idaho, Montana.
Identifiers: *Shallow subsurface flow, Interface flow, Lochsa River headwaters.

During an average snowpack season at high elevation in the Bitterroot Mountains of Montana and Idaho (a) the daily hydrograph for melt water collected in a roadway follows the classical diurnal pattern of high daytime and very low nighttime flow; (b) a larger portion of the daily volume seeps from the roadbank as shallow subsurface flow while a smaller portion flows directly over the ground surface beneath the snowpack; and (c) the daily combined volume of flow can be of considerable magnitude in terms of acre-feet.

APPLICATION OF SURFACE PRESSURE TO ASSIST WATER RECHARGE INTO THE OGALLALA FORMATION,
Texas Tech Univ., Lubbock. Dept. of Petroleum Engineering.
Philip Johnson.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 193-204, 1970. 12 p, 8 fig.

Descriptors: *Groundwater recharge, *Injection wells, *Aquifers, *Texas, Water management (Applied), Recharge, Permeability, Water wells, Groundwater movement, Water levels, Water storage, Water yeild, Hydrogeology.
Identifiers: *Ogallala aquifer (Texas).

Large volumes of water may be stored in the dewatered zones of the Ogallala aquifer in Texas and may be retained in the vicinity of recharge for a reasonable period of time to permit local usage. Costs to recharge the Ogallala aquifer with playa water or imported water are reasonable with modern pumping equipment. Rapid disposal of playa lake water permits maximum utilization of the land for farm use. Sustained high flow rates into a recharge well may be obtained by application of pump pressure at the surface. Estimated costs to drill and equip a recharge well with a turbine sump pump and electric power equipment capable of injecting 1700 GPM at 50 psig pressure total $3,969. RECHARGING THE OGALLALA FORMATION USING SHALLOW HOLES,
Texas Tech Univ., Lubbock. Dept. of Agricultural Engineering.
Marvin J. Dvoracek, and Sam H. Peterson.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 205-218, 1970. 14 p, 7 fig, 1 tab, 15 ref.

Descriptors: *Groundwater recharge, *Injection wells, *Aquifers, *Texas, Water management (Applied), Recharge, Permeability, Water wells, Groundwater movement, Water levels, Water storage, Water yield, Hydrogeology.
Identifiers: *Ogallala Aquifer (Texas).

More than fifteen acre-feet of runoff water has been recharged into the Ogallala aquifer of Texas by means of a shallow hole. During this period increased in rate of recharge were observed. A condition of soil piping is responsible for the increasing rates and disposition of the cavity material. By soil piping, the more water recharged the greater the channel sizes become, accommodating more water and more sediment. In conclusion, recharge by this method has proven to be an effective means of artificially recharging the Ogallala Formation in the area of the test. GROUNDWATER CONDITIONS IN THE HARQUAHALA PLAINS, MARICOPA AND YUMA COUNTIES, ARIZONA,
Geological Survey, Phoenix, Ariz.
E. E. Denis.
Arizona Land Department Water Resources Report, No 45, Apr 1971. 44 p, 7 fig, 2 plate, 4 tab, 7 ref, append.

Descriptors: *Groundwater, *Irrigation wells, *Hydrologic data, *Data collections, *Arizona, Aquifer characteristics, Water yield, Withdrawal, Aquifers, Water quality, Chemical analysis, Hydrogeology, Water wells, Water levels, Drawdown, Irrigation, Agriculture, Crops, Reviews.
Identifiers: *Groundwater resources, *Maricopa County (Ariz), *Yuma County (Ariz), *Harquahala Plains (Ariz), Drillers logs.

The climate in the Harquahala Plains in Arizona is arid, and precipitation is inadequate for raising crops; therefore, the groundwater reservoir is the only dependable source of water for irrigation. The first large irrigation well was drilled in 1951. In December 1966, 39,500 acres were under cultivation, and about 120 irrigation wells were in use. Most of the cultivated land is in the southeastern part of the area. The principal water-bearing strata are the sand and gravel units in the alluvium that underlies the plains. From December 1963 to December 1966, the water level declined as much as 50 feet. During this time about 3.7 million acre-feet of sediments was dewatered as a result of the withdrawal of about 560,000 acre-feet of groundwater. These data indicate a storage coefficient of about 0.15 for the aquifer. About 7.4 million acre-feet of water is available for withdrawal from the groundwater reservoir in the southeastern part of the Harquahala Plains. Chemical analyses indicate that the dissolved-solids content of the water ranges from about 500 to more than 1,000 mg/l. (Woodard-USGS)

PROJECTED GROUNDWATER DEFICIENCIES IN NORTHEASTERN ILLINOIS, 1980-2020,
Illinois State Water Survey, Urbana.
R. J. Schicht, and Allen Moench.
Illinois Water Survey Circular 101, 1971. 22 p, 10 fig, 3 tab, 11 ref.

Descriptors: *Water demand, *Water supply, *Water shortage, *Groundwater mining, *Illinois, Safe yield, Water yield, Aquifers, Water resources development, Overdraft, Water utilization, Withdrawal, Forecasting, Groundwater.
Identifiers: *Chicago (Ill).

Future groundwater demands for each township in the Chicago Region were estimated for each 10-year interval from 1980 to 2020. Relationships were found between population and per capita consumption and between manufacturing employment and per capita consumption. Estimates of demand were made on the basis of these relationships. Groundwater resources are developed from two aquifer systems. Future demands were compared with the available groundwater resource for each township, and maps were prepared showing areas of groundwater deficiency. When limiting groundwater withdrawals to recharge, a large number of townships will require importation of water by as early as 1980. By continued mining, three townships in northern Cook County will require importation by 1990. Large areas will require importation by 2020 with either approach. It is possible there is sufficient water in storage in the deeper aquifers to meet groundwater demands through 2020. (Knapp-USGS)

EROSION AND SEDIMENTATION FOLLOWING ROAD CONSTRUCTION AND TIMBER HARVEST ON UNSTABLE SOILS IN THREE SMALL WESTERN OREGON WATERSHEDS,
Pacific Northwest Forest and Range Experiment Station, Corvallis, Oreg.
R. L. Fredriksen.
USDA Forest Serv Res Pap PNW-104. 15 p.

Descriptors: *Clearcutting, *Road construction, Sedimentation rates, Sediment yield, Bed Load, Suspended load, Soil stability, Soil erosion, Landslides, Oregon, Pacific Northwest US.
Identifiers: *Experimental watersheds, Humid temperature climate, Forest roads.

In two steep headwater drainages, landslides were the predominant source of increased sedimentation of streams following timber harvest. Patch-cut logging with forest roads increased sedimentation compared with a control by more than 100 times over a 9-year period. Landslide erosion was greatest where roads crossed high gradient stream channels. In an adjacent clearcut watershed with no roads, sedimentation increased three times that of the control.

TERRAIN AND COVER EFFECTS ON SNOWMELT IN A WESTERN WHITE PINE FOREST,
Intermountain Forest and Range Exp Station, Logan, Utah.
L. E. Packer.
Forest Science, Vol 17, No 1, p 125-134, Mar 1971.

Descriptors: *Ablation, *Snowmelt, *Canopy, Elevation, *Slopes, *Clearcutting, Forest management, Snow management, White pine trees, Solar radiation, Idaho.
Identifiers: *Terain, *Aspect, Basal area, Cumulative diameter.

Whether increases in snowpack water that result from cutting timber in western white pine (Pinus monticola Dougl.) forests of the northern Rocky Mountains can create flood-producing conditions depends, in part, upon the melting behavior of the snowpack under various terrain and forest conditions. Reported are results of a 4-year study which show that snowmelt (ablation) rates are influenced significantly by differences in terrain and forest cover conditions. Differences in elevation, aspect, slope steepness, and forest cover accounted for 74 percent of the variance in snowmelt rate. Forest managers can exert some control over snowmelt rates by choosing the terrain and forest cover conditions suitable for specific forest management practices. Clearcutting of the most dense forest stands on southerly aspects at low to intermediate elevations provides largest increases in snowmelt rates. Partial cutting of timber on northerly aspects at intermediate to high elevations affords the best opportunity to effect reductions in snowmelt rates. (Packer-USFS)

SHEET EROSION ON INTERMOUNTAIN SUMMER RANGES,
Intermountain Forest and Range Experiment Station, Ogden, Utah.
Richard O. Meeuwig.
USDA Forest Serv Res Pap INT-85. 25 p.

Descriptors: *Sheet erosion, *Vegetation effects, *Soil properties, Simulated rainfall, Soil texture, Organic matter, Wettability, Range management, Slope stability, Soil stability, Soil density, Soil aggregates, Soil moisture, Impact (Rainfall), Estimating equations, Utah.
Identifiers: *Slope gradient.

Simulated rain was applied to small plots on seven mountain range land sites in Utah, Idaho, and Montana. Multiple regression equations were developed for each site relating the resultant erosion to cover characteristics, soil properties, and slope gradient. The magnitude of erosion was found to depend primarily on the proportion of the soil surface protected from direct raindrop impact by plants, litter, and--in some cases-- stone. Soil organic matter favored stability of fine-textured soils, but apparently increased erodibility of sandy soils. The regression equations are presented in tabular and nomographic form to aid the land manager in the assessment of potential sheet erosion on sites similar to those studied.

SITE REHABILITATION UNDER PLANTED REDCEDAR AND PINE,
Southern Forest Experiment Station, Oxford, Miss.
D. C. McClurkin.
In: Tree Growth and Forest Soils, p 339-345, 1970. Proc, Third North American Forest Soils Conf, 1968, Raleigh, NC.

Descriptors: *Erosion control, *Land reclamation, *Infiltration, Soil physics, Soil chemistry, Soil chemical properties, Soil analysis, Vegetation effects, Humus, Porosity, Mississippi.
Identifiers: *Site rehabilitation, Liter accumulation, Water transmission rates, Mississippi.

The study compares long-term changes in the physical and chemical properties of soil and litter on eroded old fields planted to pure stands of redcedar, loblolly pine, shortleaf pine, and mixtures of redcedar with loblolly and redcedar with shortleaf to determine which species or species combination rehabilitated the site most rapidly. Litter accumulation under pure stands of pine was more than twice as deep and three to four times as heavy as that under pure redcedar. Water transmission was three to five times faster under the pure pines than under the pure redcedar. Under shortleaf, the litter contained more nitrogen and calcium and the soil contained more organic matter than under loblolly pine. However, loblolly produced more litter than did shortleaf and water transmission was more rapid beneath it. Thus, of the two pines, loblolly appears to be superior for site protection and rehabilitation.
W71-08859

FOREST FLOOR CHARACTERISTICS IN SOUTHWESTERN WISCONSIN,
North Central Forest Experiment Station, St. Paul, Minn.
M. Dean Knighton.
USDA Forest Serv Res Note NC-102. 2 p.

Descriptors: *Humus, *Soil compaction, Grazing, Soil surfaces, Watershed management, Soil properties, Soil formation, Soil erosion, Land reclamation, Pasture management, Wisconsin.
Identifiers: *Humus variability, *Humus development, Coulee Experimental Forest.

Percent slope, aspect, topographic position, and crown closure were found to have no significant influence on forest floor depth in southwestern Wisconsin. However, a significant decrease in forest floor depth from 8.5 to 6.7 cm. and an increase in soil compaction were found on currently grazed slopes. Yet when grazing is stopped recovery is apparently quick with no permanent damage.
W71-08860

CONTAINERIZED PINES FOR ERODED WATERSHEDS,
Southern Forest Experiment Station, Oxford, Miss.
D. C. McClurkin.
Journal of Soil and Water Conservation, Vol 26, No 1, p 25-26, 1971.

Descriptors: *Forest management, *Reforestation, Erosion control, Pine trees, Plastics, Soil stabilization, Slope stabilization, Fertilization, Reclamation, Germination, Mississippi.
Identifiers: Containerized planting, Polypropylene tubing, Peat pellets, Polystyrene bullets, Seedling survival, Eroded watersheds, Planting practices.

Containerized planting appears feasible for revegetating eroded sites and extending the current planting season into the summer. In a designed study of polypropylene tubing, peat pellets, and polystyrene 'bullets,' seedlings outplanted in pellets consistently survived better than those in tubes or bullets; tubes and bullets were about equally effective. The superior performance of seedlings in pellets may be due more to the fertilizer added to pellets during their manufacture than to the container. Addition of fertilizers to soil in bullets produced dramatic increases in seedling height growth and root development in a greenhouse study. If techniques such as fertilization of the potting soil can consistently improve field survival and growth

and if planting devices can be installed on light vehicles designed for difficult terrain, containerized planting should make rehabilitation of southern watersheds far easier.

EVALUATING WATERSHED MANAGEMENT ALTERNATIVES,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
Harry E. Brown.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 97, No IR-1, Paper 7952, p 93-108, Mar 1971. 16 p, 7 fig, 6 tab, 20 ref.

Descriptors: *Watershed management, *Water resources development, *Reviews, *Arizona, Projects, Evaluation, Irrigation, Surface waters, Water yield, Vegetation effects, Sedimentation, Erosion control, Forestry, Wildlife, Clear-cutting, Runoff, Agriculture, Cattle.
Identifiers: *Beaver Creek (Ariz).

On the Beaver Creek Pilot Project in Arizona evaluations are made of watershed management designed to increase water yield. There have been modest gains in cattle forage following cabling Utah juniper and felling alligator juniper, but these are offset by complete loss of wood production. Water and sediment yields are unchanged, and wildlife effects are uncertain. There were substantial gains in water production and forage for cattle and wildlife following clear-cutting ponderosa pine, but there were large losses in terms of wood, aesthetics, and sedimentation. A more refined pine treatment, where one-third of a watershed was cleared in 60-foot strips, has been completed for 1 yr. There are indications of increased water, herbage, and wildlife yields from this treatment. Losses in the other values have been less than with clearcutting. (Woodard-USGS)

MERCURY IN THE ENVIRONMENT--SURFICIAL MATERIALS OF THE CONTERMINOUS UNITED STATES,
Geological Survey, Washington, D.C.
Hansford T. Shacklette, Josephine G. Boerngen, and Robert L. Turner.
Free on application to the US Geological Survey, Washington, DC, 20242. Geological Survey Circular 644, 1971. 5 p, 1 fig, 1 tab, 10 ref.

Descriptors: *Pollutants, *Heavy metals, *Soil chemical properties, *Environmental effects, *United States, Ecology, Earth materials, Environment, Soils, Chemical analysis, Sampling, Data collections, Distribution patterns, Path of pollutants, Histograms.
Identifiers: *Mercury, *Mercury pollution.

Mercury determinations for 912 samples of soils and other regoliths from sites approximately 50 miles apart throughout the United States are represented on a map by symbols showing five ranges of concentration. A histogram of mercury concentrations in the samples is also given. The geometric mean concentration of mercury is 71 parts per billion for all samples, 96 ppb for samples from the Eastern United States, and 55 ppb for samples from Western United States. Twelve samples contained at least 1,000 ppb mercury; the greatest concentration found was 4,600 ppb. (Woodard-USGS)
W71-08326

DETECTION OF OIL SLICK POLLUTION ON WATER SURFACES WITH MICROWAVE RADIOMETER SYSTEMS,
Microwave Sensor Systems, Inc., Downey, Calif.; and California Univ., Santa Barbara.
J. C. Aukland, W. H. Conway, and N. K. Sanders.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 2, p 789-796, 1970. 8 p, 5 fig, 5 ref.

Descriptors: *Pollutant identification, *Water pollution sources, *Oil-water interfaces, *Remote sensing, *Microwaves, Oceanography, Radio waves, Aircraft, Water temperature, Surface waters, Radiation, Tracking.
Identifiers: *Oil slick tracking, *Microwave radiometry.

Two mechanisms by which the presence of oil on a water surface may be detected are discussed. Both of these mechanisms create an apparent temperature anomaly when oil is present. It is the presence of this local anomaly in the relatively uniform background of the sea surface that will signify the detection of oil pollution. An analytical basis for the mechanisms was developed, and the results of the experimental verification are presented. The first phenomena is concerned with measuring the local change in sea state due to the presence of the oil pollution. This phenomena presents very strong signals to microwave radiometers when winds of 6 knots or more are blowing. This is a primary detection mechanism for thin oil films. The second mechanism is the direct change in the emissivity of the water surface due to the presence of oil. This phenomena is slightly the weaker of the two, but offers the promise of measuring oil thickness. Because of the independence of these two potential detection mechanisms they are described separately. (Woodard-USGS)

CHEMICAL CHARACTERISTICS OF ORGANIC COLOR IN WATER,
Washington, Univ., Seattle, Dept. of Civil Engineering.
Russell F. Cristman, Masahisa Nakamura, and Warren Williams.
Available from the National Technical Information Service as PB-199 707, $3.00 in paper copy, $0.95 in microfiche. Final Report 16020DKW 09/70, 93 p, 42 fig, 15 ref. FWQA Grant No WP-EF-01031.

Descriptors: *Color, *Computer programs, Least squares method, Mathematical model, Data processing, Sampling, Solubility, Adsorption, Hydrogen ion concentration, Volumetric analysis, Colorimetry, Colloids, Coagulation, Chemical precipitation.
Identifiers: Electrical charge, Jar tests, Graphs, Transmission, Total organic carbon, Hydrogen ion concentration meter.

The colloid charge titration technique described by Kawamura and Tanaka, was used to measure the charge on color-aluminum, color-thorium, and color-lanthanum dispersions. This method was able to measure the charge on colloids which were too small to be seen, thus replacing the Briggs microelectrophoresis cell technique. Tests were conducted using a Lumetron Model 402E filter photometer to obtain data points of pH vs % transmission; and pH vs total organic carbon. A computer program was designed to perform a least squares analysis on all the data points to determine the shape of the curve, and the curves were then plotted on a plotter. The program which was developed will analyze as many as 15 sets of data. Analyses made on data taken from actual colored influent will provide operators with plots which show the optimum operating conditions for a particular color removal problem. (Lowry-Texas)

ROLE OF MICROORGANISMS GROWING ON OIL IN THE SELF-CLEANING AND INDICATION OF OIL POLLUTION IN THE SEA,
O. G. Mironov.
Available from the National Technical Information Service as JPRS 52491, $3.00 in paper copy, $0.95 in microfiche. Translated from: Okeanologiya, V 10, No 5, p 820-827, 1970, JPRS-52491, Feb 197 12 p, 3 fig, 17 ref.

Descriptors: *Oil, *Oil wastes, Oily water, *Indicators, *Water pollution sources.
Identifiers: *Biodeterioration, Oxidation, Black Sea, Indian Ocean, Marine microorganisms, Hydrocarbons, Peptones, USSR, Translations.

The microorganisms isolated from the water of the Black Sea and Indian Ocean can grow on oil and oil products, using them as the only source of carbon and energy. This fact suggests a possible oxidation of oil products that occur in the sea. However, the vast majority of hydrocarbon-oxidizing microorganisms show an ability to grow not only on hydrocarbons but also on other carbon sources, e.g. on peptones. Therefore, when hydrocarbon and non-hydrocarbon sources of carbon, specifically oil and sewage, co-occur in the sea, the self-cleaning of organic sewage components from the sea area will be more rapid than the rate of decomposition in the sea water. A close correlation between the presence of hydrocarbon-oxidizing microorganisms and oil pollution of sea water provides a logical basis for regarding the group of bacteria as an oil pollution indicator.

present state of water quality information ms is poor. The shortest response time een the recognition of pollution problems in a r water body and its solution is between fifteen twenty years. Adequate forecasting systems ld shorten this response time to prevent in-n degradation. Most of the nation's waters are ted because of this long response time. As a t of a research and development grant from Federal Water Quality Administration, the sylvania Department of Health is in the ess of developing a Water Quality Manage-Information System, designed to show how a can, to the fullest extent, develop such a m and base its operations on the utilization of a system. The first year of the grant has just concluded and two major modules of the prehensive system, a water quality module and ilities module have been designed and pro-med. RDINATION - THE KEY TO EFFECTIVE ER DATA MANAGEMENT,
ogical Survey, Washington, D.C. Office of r Data Coordination.
Langford, and W. W. Doyel.
eedings of the National Symposium on Data Instrumentation for Water Quality Manage-, Conference of State Sanitary Engineers and onsin University, July 21-23, 1970, Madison, p 8-32, 1970. 25 p, 11 fig.

Descriptors: *Hydrologic data, *Data collections, *Data storage and retrieval, *Data processing, Management, Planning, Water resources research act, Governments, Federal government, Inter-agency cooperation, Conferences, Reviews.
Identifiers: *Water data management, Office of Water Data Coordination.

Although there are large quantities of water data being acquired in the United States and large amounts of money being spent on that acquisition and the subsequent handling, the data are not fully utilized, nor are they always acquired at the proper place or at the proper time. The cost of acquiring the data increases as part of the general increase in the cost of doing any type of activity. Therefore, in order to give the data user the date he needs in the format in which he needs them and in the time frame in which he requires them, it is necessary to fully coordinate data acquisition activities. Thus, by lumping needs, preparing a unified acquisition program and entering the resultant data in a data handling system, maximum use can be made of a minimum amount of data. Within the Federal establishment coordination procedures now are being tested. (See also W71-08550) (Knapp-USGS)
W71-08552

BASIC DATA REQUIREMENTS TO EVALUATE WATER POLLUTION IN QUALITY CONTROL PROGRAMS,
NUS Corp., Pittsburgh, Pa. Cyrus William Rice Div.
Paul V. Morgan.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 33-56, 1970. 24 p, 6 tab, 4 ref.

Descriptors: *Monitoring, *Water pollution control, *Reviews, *Water quality, *Water Quality Act, Instrumentation, Programs, Governments, Data collections, Hydrologic data, Management, Planning, Federal government, Inter-agency cooperation, Conferences.
Identifiers: *Water quality data.

The effective conduct of a national pollution control program requires that reliable information on water quality be collected, analyzed, and evaluated in a timely and efficient manner. The real progress during the last decade has been in the number and variety of applications of automatic water quality monitoring equipment throughout the country by a variety of federal, state, and interstate agencies, and private groups. There are quite a number of industrial plants utilizing monitors in major effluent streams. The Federal Water Pollution Control Act amendments in 1961, the Water Quality Act of 1965, the Clean Water Restoration Act of 1966, the Water Quality Improvement Act of 1969, the Federal Water Pollution Control Act of 1970 continued the ever-increasing involvement of the federal government in water pollution control which had previously been allocated to the states. A SYSTEMS APPROACH TO WATER QUALITY DATA MANAGEMENT,
Price Waterhouse and Co., Philadelphia, Pa. Management Advisory Services.
George B. Murdock.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 57-75, 1970. 19 p, 7 ref.

Descriptors: *Systems analysis, *Monitoring, *Water pollution control, *Reviews, *Water quality, *Water quality act, Instrumentation, Programs, Governments, Data collections, Hydrologic data, Management, Planning, Federal government, Inter-agency cooperation, Conferences.
Identifiers: *Water quality data.

Review of the literature reveals that pollution control and other environmental quality problems are complex enough to be examined by means of the systems approach. The insights gained may lead to better solutions. With the advent of modern systems techniques, increasing interest in them has been shown by federal, state, and local governments and other decision making bodies. A water quality management information system will greatly enhance the speed and precision with which decisions may be made in the water quality management field, and thereby increase the effectiveness of the program as a whole. The Commonwealth of Pennsylvania is developing new water quality management techniques by applying modern systems concepts to a state program. This project has been supported and financed, in part, by the Federal Water Quality Administration, Department of the Interior, pursuant to the Federal Water Pollution Control Act. It is intended that this project will develop uniform systems techniques applicable to other states' water pollution control programs. (See also W71-08550) (Knapp-USGS)

LESSONS TO BE LEARNED WHEN COLLECTING VALID DATA,
Manhattan Coll., Bronx, N.Y. Dept. of Civil Engineering.
Robert V. Thomann.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 76-86, 1970. 11 p, 5 fig, 1 ref.

Descriptors: *Data collections, *Hydrologic data, *Water quality, Monitoring, Model studies, Water pollution control, Reviews, Conferences, Mathematical models, Systems analysis.
Identifiers: *Water quality data.

The validity of data involves the uses that are made of the information that is collected for water quality studies. In addition, the validity of data is determined by (1) conditions of sampling, (2) accuracy of the measurement of the sample, and (3) the time-space variability of the systems that are being sampled. The uses to which data are being put must be analyzed carefully so that a meaningful sample collection program can be devised. Cognizance must be taken of the expected response times of systems, the order of magnitude of the response times, and load and water quality variability, all of which determine the space and time details of the sample collection program. W71-08555

EXPERIENCES WITH AUTOMATION IN REMOTE SAMPLING AND ANALYSIS OF SURFACE WATERS,
American Chain and Cable Co., Glen Cove, N.Y. Bristol Datamaster Div.
L. P. Sill, Jr.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 87-98, 1970. 12 p, 4 fig.

Descriptors: *Telemetry, *Monitoring, *Water quality, *Water pollution control, *Illinois, Reviews, Conferences, Sampling, Data collections, Hydrologic data, Canals, Sewage treatment, Storm runoff.
Identifiers: *Chicago (Ill), *Water quality data.

The Chicago Sanitary District covers 850 square miles and provides water and sewage facilities for a population of 5.5 million plus an industrial load equivalent to an additional 3 million people. It maintains 71 miles of inland water ways. The plan uses an installed and fully operational integrated Data Acquisition System to monitor water quality of the water ways and point the way to the most efficient methods of the pollution abatement. The system consists of eleven monitoring stations, three

secondary receiving stations, and one central receiving station. Each monitoring station telemeters its sampling data to one secondary station and to the central station. The secondary stations are located at each of the major sewage treatment works which discharge effluent to the water ways. Because of the location of the monitoring stations, each treatment plant knows the quality of water entering the system, the condition of the effluent discharges, and the quality of the water leaving its system. W71-08556

FORECASTING OF WATER QUALITY DATA IN THE DELAWARE RIVER ESTUARY,
Delaware River Basin Commission, Trenton, N.J.
Peter K. MacEwen, and Richard C. Tortoriello.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 99-123, 1970. 25 p, 19 fig, 1 tab, 5 ref.

Descriptors: *Mathematical models, *Delaware River, *Delaware River Basin Commission, *Monitoring, *Dissolved oxygen, Reviews, Conferences, Streamflow, Sewage, Water quality, Water pollution control, Data collections, Hydrologic data, Sampling.
Identifiers: *Water quality data.

A mathematical model of both steady-state and the time-varying water quality was developed for the Delaware Estuary. The model demonstrates the cause-and-effect relationship between oxygen demanding waste material, both carbonaceous and nitrogenous, and the resulting DO level in the Estuary. The water quality models are realistic predictors of both dissolved oxygen and salinity for years 1964 and 1968, under different conditions of waste loading and stream flows. In establishing water quality effluent standards for industries and municipalities, the steady-state model was used to determine the cause-effect relationship between stream DO and the waste load discharged to the Estuary. Use of such a model permitted the investigation of various alternatives of waste treatment in the Estuary and the resulting effects on the river. (See also W71-08550) (Knapp-USGS)
W71-08557

NEED FOR WATER QUALITY DATA IN PLANNING WATER RESOURCE DEVELOPMENTS,
Geological Survey, Lincoln, Nebr. Water Resources Div.
Lester R. Petri.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 125-129, 1970. 5 p.

Descriptors: *Data collections, *Data processing, *Hydrologic data, *Water quality, Monitoring, Water resources development, Planning, Reviews, Conferences, Analytical techniques, Statistical methods.
Identifiers: *Water quality data.

Water quality data needed in planning may be separated into two categories: (1) basic data, and (2) interpretive data. Basic data are those obtained by direct measurement of the resource itself or of the environment in which the resource is found. Interpretive data are those derived by analysis of basic data. They may be statistical indices such as means, modes, or coefficients of correlation. A program must consider the fact that important changes in water quality sometimes take place gradually and cannot easily be detected with short-term records. Also, the proper range of conditions to be sampled cannot be depended upon to occur in any given year. Therefore, operation of the program must be on a continuing basis so that data representing long-term conditions will be available when they are needed. A carefully designed program identifies the kinds of measurements most likely to be needed and provides for their collection. Provisions in the program must be made to review periodically the data being collected for its intrinsic value. (See also W71-08550) (Knapp-USGS)
W71-08558

DATA NEEDS IN ENGINEERING DESIGN,
Datagraphics, Allision Park, Pa.
Henry C. Bramer.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 130-136, 1970. 7 p.

Descriptors: *Data collections, *Hydrologic data, *Planning, *Monitoring, *Water pollution control, Costs, Water quality, Abatement, Water quality control, Water quality act.
Identifiers: *Water quality data.

This review of data needs is directed to those specifically usable for engineering design purposes, on the basis that facilities are constructed to maintain specified water quality levels required by the uses to be made of receiving streams, and that such objectives are to be realized in the most generally cost-effective means possible. The total engineering effort includes the engineering input of the regulatory agencies as well as that of the design engineer. As mathematical modeling techniques applicable to the prediction of water quality in stream, to process design, and to cost estimation become more sophisticated, the practical uses of water quality information will increase. These techniques allow the engineer to comprehensively weigh alternatives so as to define the most cost effective. (See also W71-08550) (Knapp-USGS)
W71-08559

NEED FOR WATER QUALITY DATA IN OPERATING WATER IMPOUNDMENTS,
Bureau of Reclamation, Washington, D.C. Div. of Water and Land Operations.
Maurice N. Langley.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 137-144, 1970. 8 p.

Descriptors: *Water quality control, *Reservoir operation, *Data collections, *Monitoring, Water utilization, Reservoir stages, Lake morphometry, Hydrologic data, Water storage, Water pollution sources.
Identifiers: *Water quality data.

The need for water quality data in operating water impoundments is governed largely by the characteristics of the inflows; the location, size, depth, and configuration of the impoundment; the activities of man on the water and shorelines; the direct multiple uses of the impoundment; and the downstream purposes for which the water is to be used. A regular monitoring program of input, in storage, and downstream water quality characteristics, coupled with knowledge of the effects of water quality on the multiple purposes that an impoundment is to serve, can assist greatly in maximizing benefits. Such data will serve to point up at an early stage the development of undesirable reservoir characteristics. (See also W71-08550) (Knapp-USGS)

GANIZING A DATA COLLECTION PRO-AM,
eau of Reclamation, Sacramento, Calif.
Martin Roche.
ceedings of the National Symposium on Data Instrumentation for Water Quality Manage-nt, Conference of State Sanitary Engineers and consin University, July 21-23, 1970, Maidson, p 183-191, 1970. 9 p, 1 fig.

criptors: *Data collections, *Data processing, ta transmission, *Hydrologic data, *Networks, emetry, Statistics, Monitoring, Water quality, ter quality control.
ntifiers: *Water quality data, *Data systems gn.

California, several state and federal agencies k together in organizing a water quality data ection program. By using a coordinated ap-ach and by maintaining contact throughout the gram, men and equipment can be efficiently l, duplicated efforts can be avoided, costs can ninimized, and accurate, consistent data can be ined. The U. S. Bureau of Reclamation's Water lity Surveillance Program in the San Francisco -Delta Estuary is an excellent example of a perative study. The Delta plays a key role in the eau's Central Valley Project and in California's e Water Project, as it serves as the collection export point for water stored in reservvoirs in hern California. Water is released from storage is pumped from the Delta channels to be sent canals to agricultural lands in the semiarid San quin Valley. Data collection for the program is ied out under the supervision of the Bureau relations of results using different methods of ysis are made so that the results can be placed a common basis. ommon exchange of ideas and techniques veen users in the analysis and design of new r quality data systems can contribute much rd increased compatibility between systems. U. S. Geological Survey's Water Resources sion has greatly increased the compatibility of oftware systems by implementing procedures he bilingual interfacing of computer languages. example, a computer procedure written in the TRAN IV language can now be used as a outine within a procedure written in the PL/1 uage. This has allowed the Division to greatly nd its use of existing internal and external edures with only a minimal amount of modifi-n to the original source. The Water Resources sion now has the advantage of using existing, large-scale and standardized statistical packages and processing procedures available in the computer library of the U. S. Geological Survey for the analysis and meaningful reduction of its data. (See also W71-08550) (Knapp-USGS)

EXPERIENCES WITH A WATER POLLUTION CONTROL STORAGE AND RETRIEVAL SYSTEM (STORET),
Federal Water Quality Administration, Washington, D. C. Pollution Surveillance Branch.
Phillip L. Taylor.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 198-207, 1970. 10 p, 7 fig.

Descriptors: *Computer programs, *Data storage and retrieval, *Data processing, *Data collections, *Hydrologic data, Water quality, Digital computers, Telemetry, Statistics, Networks, Planning, Reviews.
Identifiers: *Water quality data, *STORET system.

Water pollution control data related to the nation's 3,500,000 miles of flowing streams, over 12,000 miles of general coastline and more than 65,000 square miles of inland open waters are extensive in amounts and varieties. Computers are capable of accepting vast amounts and varieties of data with similar ability to feed back selected information. The Federal Water Quality Administration's STORET System is used primarily for the handling of water quality data. The addition of a variety of remote teleprocessing devices, digitization, and digital plotting applications to the system, and the use of microfilm, all together, represent an extensive system application. With use of remote terminals, particularly low speed types, both digital and CRT, field personnel at any location can have access to data and other information to meet day-to-day needs, thus facilitating the operation of a responsive water pollution control program. (See also W71-08550) (Knapp-USGS)
W71-08567

EXPERIENCE WITH STORAGE AND RETRIEVAL OF GROUNDWATER DATA,
Geological Survey, Washington, D. C. Water Resources Div.
L. G. Moore.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers, and Wisconsin University, July 21-23, 1970, Madison, Wis, p 208-213, 1970. 6 p.

Descriptors: *Computer programs, *Data storage and retrieval, *Data processing, *Data collections, *Hydrologic data, Water quality, Digital computers, Telemetry, Statistics, Networks, Planning, Reviews.
Identifiers: *Water quality data, *U. S. Geological Survey.

The Water Resources Division of the U. S. Geological Survey has been utilizing the present punch card system for the storage and retrieval of groundwater data for the past six years. Further automation of the Division's historical file was accomplished by the creation of a central data file. To gain greater efficiency in handling the data, the system was divided into three main data bases: well inventory data, quality of water data, and water level data. The well inventory data base describes the geological and hydrologic characteristics and the physical features of the well. The quality of water data base contains the basic chemical analysis and radiochemical data. The water level data base contains descriptive material and the water levels observed in the well. (See also W71-08550) (Knapp-USGS)
W71-08568

A WATER QUALITY STORAGE AND RETRIEVAL SYSTEM FOR REGIONAL APPLICATION,
Texas A and M Univ., College Station.
Roy W. Hann, Jr., and Ted M. Sparr.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 214-222, 1970. 9 p, 2 fig.

Descriptors: *Computer programs, *Data storage and retrieval, *Data processing, *Data collections, *Hydrologic data, Water quality, Digital computers, Telemetry, Statistics, Networks, Planning, Reviews.
Identifiers: *Water quality data, *U. S. Geological Survey.

Data storage and retrieval systems are briefly reviewed. Basically, any scheme for saving data and selectively recalling it later qualified as a storage and retrieval system, whether or not a computer is involved. A computerized data management system may be defined as a set of programs which manages the data base. A list of these management activities commonly includes: data base creation; file maintenance; selective retrieval; and support of high-level file description and retrieval languages used to direct system activities. (See also W71-08550) (Knapp-USGS)
W71-08569

THE HIGH RESOLUTION NMR SPECTRA OF PESTICIDES, I. ORGANOPHOSPHORUS PESTICIDES,
Federal Water Pollution Control Administration, Athens, Ga. Southeast Water Lab.
Lawrence H. Keith, Arthur W. Garrison, and Ann L. Alford.
Journal of the Association of Official Analytical Chemists, Vol 51, No 5, p 1063-1094, Sept 1968. 10 fig, 3 tab, 22 ref. EPA Project No 16020 EWC.

Descriptors: *Pesticides, *Nuclear Magnetic Resonance, *Organophosphorus pesticides, Data Collections, Spectroscopy, *Pollutant identification, Analytical techniques.
Identifiers: Chemical shifts, Coupling constants, Spin decoupling.

A description of the 100 MHz nuclear magnetic resonance spectra of 40 organophosphorus pesticides is presented with a list of their chemical shifts and coupling constants. The more complex or unusual spectra are reproduced and discussed. Tables of trends in chemical shifts are reproduced and discussed. Tables of trends in chemical shifts and coupling constants as related to structure are included. (See also W71-08587 thru W71-08590) (Alford-EPA-Southeast Water Laboratory)
W71-08586

THE HIGH RESOLUTION NMR SPECTRA OF PESTICIDES, II. THE DDT-TYPE COMPOUNDS,
Federal Water Pollution Control Administration, Athens, Ga. Southeast Water Lab.
Lawrence H. Keith, Ann L. Alford, and Arthur W. Garrison.
Journal of the Association of Official Analytical Chemists, Vol 52, No 5, p 1074-1092, Sept 1969. 7 fig, 3 tab, 18 ref. EPA Project No 16020 EWC.

Descriptors: *Pesticides, *Nuclear Magnetic Resonance, *DDT, Data collections, Spectroscopy, *Pollutant identification, Analytical techniques.
Identifiers: Chemical shifts, Coupling constants, Spin decoupling.

The 100 MHz nuclear magnetic resonance spectra of the DDT class of pesticides and related compounds are discussed. Various substituents affect the resonances of the aromatic protons. The CCl sub 3 moiety on the alpha-carbon strongly deshields the ortho protons on the aromatic rings, and this deshielding effect is greatly enhanced by

substitution of a chlorine ortho rather than para on the aromatic ring. These deshielding effects are explained by considering the substituent electronegativity and the molecular stereochemistry. Chemical shifts and coupling constants are tabulated. (See also W71-08586 and W71-08588) (Keith-EPA-Southeast Water Laboratory)
W71-08587

THE HIGH RESOLUTION NMR SPECTRA OF PESTICIDES, THE CARBAMATES,
Federal Water Pollution Control Administration, Athens, Ga. Southeast Water Lab.
Lawrence H. Keith, and Ann L. Alford.
Journal of the Association of Official Analytical Chemists, Vol 53, No 1, p 157-179, Jan 1970. 8 fig, 3 tab, 11 ref. EPA Project No 16020 EWC.

Descriptors: *Pesticides, *Nuclear magnetic resonance, *Carbamate pesticides, *Thiocarbamate pesticides, Data collections, Spectroscopy, *Pollutant identification, Analytical techniques.
Identifiers: Chemical shifts, Coupling constants, Spin decoupling.

The 100 MHz nuclear magnetic resonance spectra of 35 carbamate pesticides and a major metabolite of one pesticide are discussed. Chemical shifts and coupling constants are tabulated, and reproductions of the more complex or unusual spectra are included. A concentration and solvent dependence of both the NH-proton and the NCH3-proton resonances of an N-monosubstituted carbamate is discussed. Hindered rotation is observed in the N,N-dimethylcarbamates, the thiolcarbamates, and the dithiocarbamates, but not in the N-methylcarbamates. (See also W71-08586 and W71-08587) (Alford-EPA-Southeast Water Laboratory)
W71-08588

SUPPLEMENTARY INTERPRETATIONS OF THE NMR SPECTRA OF PHOSPHORUS PESTICIDES,
Federal Water Pollution Administration, Athens, Ga. Southeast Water Lab.
Lawrence H. Keith, and Ann L. Alford.
Analytica Chimica Acta, Vol 44, p 447-448, 1969. 2 ref. EPA Project No 16020 EWC.

Descriptors: *Pesticides, *Nuclear Magnetic Resonance, *Organophosphorus pesticides, Spectroscopy, *Pollutant identification, Analytical techniques.
Identifiers: Chemical shifts, Coupling constants, Spin decoupling.

A brief comparison of the interpretations of the 100-MHz organophosphorus pesticide NMR spectra with the 60-MHz data previously reported by other researchers illustrates the benefits of high resolution and homonuclear decoupling. (See also W71-08586) (Alford-EPA-Southeast Water Laboratory)
W71-08589

REVIEW OF THE APPLICATION OF NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY IN PESTICIDE ANALYSIS,
Federal Water Pollution Control Administration, Athens, Ga. Southeast Water Lab.
Lawrence H. Keith, and Ann L. Alford.
Journal of the Association of Official Analytical Chemists, Vol 53, No 5, p 1018-1035, Sept 1970. 1 fig, 47 ref. EPA Project No 16020 EWC.

Descriptors: *Pesticides, *Nuclear Magnetic Resonance, Data collection, *Pollutant identification, Analytical techniques.
Identifiers: Chemical shifts, Coupling constants, Pesticide residue analysis, Pesticide metabolites, Pesticide photolysis.

This review included all references to July 1970, where NMR spectroscopy has been used for structural elucidation of pesticide metabolites and degradation products, for structural confirmation of new pesticides, or for product analysis of existing ones. RECOGNITION OF BUNKER OILS BY THIN-LAYER CHROMATOGRAPHY,
Fisheries Research Board of Canada, Halifax (Nova Scotia).
J. C. Sipos, R. G. Ackman, and R. F. Addison.
Fisheries Research Board of Canada, New Series Circular No 37, May 6, 1970. 6 p, 5 fig.

Descriptors: *Chromatography, *Oil, *Analytical techniques, *Pollutant identification, *Water analysis, Chemical analysis, Oil water, Oil wastes, Indicators, Tracers, Laboratory tests, On-site data collections, On-site tests.
Identifiers: *Thin-layer chromatography, *Oil pollution, *Bunker oil.

Bunker oil contains several groups of 'aromatic' compound carbon skeletons. If these groups could be recognized and proportions estimated, it would be possible to examine oil slicks or beach deposits and compare the oil with samples from suspected ships or other sources, and to examine animal life for bunker oil packup. Compounds of this type, with one or two insignificant exceptions, are not normally found in marine plants or animals. A procedure simple enough for field use is described. (LeGore-Washington)

HASL-242, April 1, 1971, p I35-I78, 7 fig, 4 tab, 25 ref. AEC Contract No AT (45-1)-2091.

Descriptors: *Carbon radioisotopes, *Nuclear explosions, *Ocean circulation, *Carbon dioxide, Equilibrium, Atmosphere, Oceans, Geophysics, Vertical migration, Oceanography, Sampling, Radioactivity techniques.

Of the world inventory of natural carbon-14, about 51 metric tons, over 90% is in the oceans. Atmospheric nuclear testing increased the supply about 3%. Some 2/3 of the increase has already been transferred to the oceans, an amount sufficient to increase the carbon-14 of the upper 150 m by 25%. Evidence of bomb carbon-14 was shown in the upper few hundred meters of most ocean areas, to 700 meters in some areas, and to 3600 meters in the North Atlantic. The experimental method included stripping on board ship 60 liter seawater samples of carbon dioxide which were sent to a laboratory for counting. (See also W71-08649) (Bopp-ORNL)

CONCENTRATION OF TRACE ELEMENTS IN ENVIRONMENTAL SAMPLES WITH A CENTRIFUGAL CONTRACTOR,
Du Pont de Nemours (E. I,) and Co., Aiken, S. C. Savannah River Lab.
R. C. Milham, and D. W. Hayes, and F. E. Butler.
Health Physics, Vol. 20, No. 1, p 91-3, 1971.

Descriptors: *Zinc radioisotopes, *Water analysis, *Radiochemical analysis, Environmental effects, Trace elements, Separation techniques, Neutron activation analysis, Spectroscopy.
Identifiers: Extraction.

The centrifugal contractor is suitable for a variety of extraction processes. By contractor modification, organic extractants with densities greater than water can be used. The contractor can also be used for concentrating trace organic material in suitable solvents. It is also applicable to traces of stable nuclides which are first concentrated and then analyzed by standard analytical methods such as neutron activation, atomic absorption, etc. (Bopp-ORNL)

GAS CHROMATOGRAPHIC ANALYSIS OF TOXAPHENE IN NATURAL WATERS, FISH AND LAKE SEDIMENTS,
Wisconsin Univ., Madison. Water Chemistry Lab.
Robert A. Hughes, Gilman D. Veith, and G. Fred Lee.
Water Research, Vol 4, p 547-558, 1970. 5 fig, 1 tab, 15 ref.

Descriptors: *Gas chromatography, *Analysis, *Chlorinated hydrocarbon pesticides, Fish, Lakes, Sediments, Wisconsin, Suspended load, Plankton, Colorimetry, Diffusion, Sampling, Chromatography.
Identifiers: *Cleanup procedures, Toxaphene, Pesticide analysis, Planimetry, Organic interference, Florisil.

The rate of toxaphene, used in Wisconsin for rough fish control, was investigated to determine if water quality parameters could be linked to successful treatment, to evaluate the role of lake sediments in detoxification of toxaphene, and to assess effects of persistent toxaphene residues on restocked fish. The established procedures for removal of chemical interferences from samples for analysis needed modification or supplementary cleanup steps to cope with the organic interferences present in aquatic samples: for example, solids from vegetative sources in water and suspended solids; fats and oils from fish. Special procedures were developed for water, suspended solids, net plankton, fish and sediment. Presence of toxaphene was verified by thin-layer chromatography. Substances which interfered with the electron-capture gas chromatographic quantitation of toxaphene were removed from sample extracts by column chromatography on Florisil, magnesium oxide, alumina and a Celite, either alone or in combinations. Since each lake system requires specific procedures to cope with the intereferences present in each body of water, samples were obtained before the toxaphene treatment. Efficiency of procedures depends on quantity and character of organic material present. (Jones-Wisconsin)

Revue Internationale d'Oceanographie Medicale, Dentre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Institut National de la Sante et de la Recherche Medicale, Foundation de la Ville de Nice, Nice, Vols 18 and 19, 1970, p 125-129.

Descriptors: *Sea water, *Fungi, *Antibiotics, *Bioindicators, *Self purification, Pollutant identification, Water purification.

Ten years of research on the extraordinary disappearance of germ pathogens and indicators of fecal pollution in the littoral waters of Cuma, where physical, hydrological and meteorological conditions make dilution difficult, are reported. The biological factors which intervene in the self-purification of these waters, particularly the phenomenon of antipathy was examined. The antibiosis phenomenon has been thought not to take place in natural environments and in the presence of other microorganisms because there would be an infinite number of antibiotic-resistant strains. However, this study indicates that it is not impossible that the antibiotic-producing strains are capable of producing antibiotics in nature and in the presence of other microorganisms but their action is not manifested because they are destroyed very rapidly. AERIAL PHOTOGRAPHIC STUDIES OF THE COASTAL WATERS OF NEW YORK AND LONG ISLAND,
Virginia Univ., Charlottesville. Dept. of Environmental Science; New York Univ., Bronx. Dept. of Biology.
Mahlon G. Kelly, and Louis Castiglione.
Available from the National Technical Information Service as AD-715 804, $3.00 in paper copy, $0.95 in microfiche. Nov 12, 1970. 52 p, 6 tab, 11 fig, 14 ref. USNOO Contract N62306-70-A-0073-0003.

Descriptors: *Coasts, *Aerial photography, *Photography, *Data collections, *Water analysis, *Benthos, Remote sensing, New York, Pollutant identification.
Identifiers: Photoenhancement, Photo interpretation, *Long Island (NY).

Results from aerial photographic studies of the coastal waters of New York and Long Island are presented. Appropriate aerial photographs of the test sites and photoenhancement for quantitative analysis of the images were acquired. Measurement of oceanographic parameters such as suspended material concentrations, particle analysis, phytoplankton composition, chlorophyll concentration, salinity and temperature; the examination of benthic conditions; and continuous sampling of a tidal interface were conducted. Analysis of particle and phytoplankton samples, mapping of benthic vegetation and reduction and interpretation of much of the data is incomplete. Sampling will continue in the Montauk Point, Chesepeake Bay, and Cape Hatteras areas for comparative studies. (Ensign-PAI)

MONITORING ECOLOGICAL CHANGES IN THE MARINE ENVIRONMENT,
Clapp (William F.) Labs., Inc., Duxbury, Mass.
Robert E. Hillman.
Preprint Ecological Problems in the Marine Environment, 1st National Biological Congress, American Institute of Biological Sciences and Federation of American Societies for Experimental Biology, p 33-43, November 10, 1970, 1 fig, 1 tab.

Descriptors: *Monitoring, *Environmental effects, *Oceans, *Mathematical models, *Ecosystems, Model studies, Biological communities, Control systems, Water pollution effects, Sampling, Data collections.

Many man-induced factors can produce relatively rapid changes in the marine environment. With increased uses of the marine environment, there is an increased need for effective monitoring of these changes. The problems are what to monitor, how to monitor, and how to analyze data. Mathematical simulation models are one solution to these problems of predicting ecological changes and population responses. Mathematical models can be grouped into statistical models or deterministic models, but to develop the top-echelon model for a marine ecosystem up to five categories of models may be needed: hydrodynamic (flow) model, chemical-quality model, temperature model, atmospheric model, and biological (ecological) model. A brief explanation of the requirements of each of the physical environment models is given. A thorough examination of the less developed biological modeling is presented, including a table listing the data acquisition steps for a biological model. Results and projections of top-echelon models demand the interpretations of experienced ecologists, and, when properly used, can provide the most efficient approach to problems of monitoring ecological change in the marine environment. Identifiers: *Fecal contamination, *Fecal coliforms, Microbiological methods, Raw vegetables, Produce handling.

Bacteriological data collected from various field studies involving irrigation water, field crops, and soils were studied with respect to sources and magnitude of fecal contamination associated with cultivation, harvesting, and marketing of fruits and vegetables. Other reports concerned with contamination during agricultural activities were reviewed. Fecal coliform densities proved to be a better measurement of the probable occurrence of waterborne pathogens than any single test for a specific pathogenic group. When the fecal coliform density per 100 ml was above 1,000 organisms in various stream waters, Salmonella occurrence reached almost 100 per cent frequency. These data support the establishment of the proposed limit of 1,000 fecal coliforms per 100 ml of irrigation water, but approved sanitation practices must accompany (or supplement) use of this bacteriological standard. A concept of multiple safeguards to limit the public health hazard associated with poor quality irrigation water, irrigation farming practices, and market preparation of produce is discussed from the microbiological viewpoint. THE APPLICATION OF NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY TO PESTICIDE ANALYSES,
Environmental Protection Agency, Athens, Ga. Southwest Water Lab.
L. H. Keith, and A. L. Alford.
Varian Instrument Applications, Vol 5, No 1, Feb 1971, p 2-3. 7 ref.

Descriptors: *Nuclear magnetic resonance, *Pesticides, *Reviews, *Spectroscopy, Pollutant identification, Pesticide residues.
Identifiers: Pesticide metabolites, Pesticide photolysis products.

This review points out that NMR has been used successfully in pesticide analyses and supplies information difficult and sometimes impossible to obtain by other means. Applications listed are: pesticide residue analyses, elucidation of photolysis products, characterization of synthesized pesticide metabolites, studies of reaction and intermediate products, and structural elucidation of pesticides. Collections of pesticide spectra in the literature are listed. (See also W71-08834 thru W71-08836 and W71-08586 thru W71-08590) (Keith-EPA)

Identifiers: *Chemical shifts, *Coupling constants, Spin decoupling, Molecular asymmetry.

The doubling of the NMR signals of the isopropyl methyl protons in 2,4-dichlorophenyl methyl isopropylphosphoramidate has been shown to be due to a difference in chemical shift of the two methyl groups. This difference is ascribed to a steric hindrance to rotation about the N--C bond which enhances the inherent nonequivalence due to molecular asymmetry. Studies of the changes in chemical shift difference with changes in temperature, concentration and solvent show the steric hindrance to be due to intermolecular hydrogen bonding. The NMR data are correlated with infrared spectra of the phosphoramidate obtained under similar conditions; these spectra support the hydrogen bonding hypothesis. Possible hydrogen-bonded species are discussed. (See also W71-08833) (Garrison-GPA)

RIENCES WITH OPERATING AN AUTO-C WATER QUALITY MONITORING EM IN AN ESTUARINE ENVIRONMENT,
l Water Quality Administration, Edison, udson-Delaware Basins Office.
W. Bromberg, and Manuel Carames.
dings of the National Symposium on Data strumentation for Water Quality Manage-Conference of State Sanitary Engineers and nsin University, July 21-23, 1970, Madison, 248-255, 1970. 8 p, 2 fig, 1 ref.

ptors: *Telemetry, *Data collections, r quality, *Monitoring, *Instrumentation, gen ion concentration, Electrical con-ce, Water temperature, Oxidation-reduction al, Dissolved oxygen, Turbidity, Chlorides, des.
iers: *Water quality sensors.

Since 1963 the Federal Water Quality Administration, Hudson-Delaware Basins Office, has operated a network of four automatic water quality monitors in the New York Harbor area. A fifth station was installed in late 1969. Water quality monitoring instrumentation was originally installed as a surveillance mechanism for two Federal Enforcement Conferences (Raritan Bay and Hudson River and New York Harbor) and is also providing vital historical data. Each monitor consists of a flow cell cubicle, an analyzer cubicle capable of holding eight parametric modules and a telemeter cubicle. Sample intake pumps are located at 5 feet above the bottom, mid-depth and 5 feet below the surface (mean tide level). On the average, valid water quality data are presently obtained 91% of the time. Of the 9% loss, approximately half is due to down time of the teletype lines, and the remainder is due to monitor equipment breakdown or malfunction. All monitoring stations are linked together in series with the central receiving station on a commercial leased teletype line. (See also W71-08550) (Knapp-USGS)
W71-08875

NEW YORK STATE AUTOMATIC WATER QUALITY MONITORING SYSTEM,
New York State Dept. of Health, Albany. Water Quality Surveillance Section.
Ronald E. Maylath.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 256-260, 1970. 5 p.

Descriptors: *Telemetry, *Data collections, *Water quality, *Monitoring, *Instrumentation, *New York, Hydrogen ion concentration, Electrical conductance, Water temperature, Oxidation-reduction potential, Dissolved oxygen, Turbidity, Chlorides, Fluorides.
Identifiers: *Water quality sensors.

The New York water quality surveillance network consists of approximately 200 active surface water sampling stations. The automatic monitoring system for New York's waters is designed to be highly reliable with a minimum of maintenance. The system consists of three basic parts: monitor, telemeter, and computer. Environmental parameter equipment measures pH, dissolved chlorides, dissolved oxygen, dissolved fluorides, conductivity, water temperature, turbidity, water stage height, solar radiation intensity, and air temperature. Environmental parameter alarms detect parameter values exceeding a preset limit and automatically collect a water sample. Functional command equipment allows remote control of various components in the monitor. (See also W71-08550) (Knapp-USGS)

AUTOMATED STREAM QUALITY SENSING NETWORK IN NEW JERSEY,
Geological Survey, Trenton, N.J. Water Resources Div.
Peter W. Anderson, John J. Murphy, and Samuel D. Faust.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 261-281, 1970. 21 p, 12 fig, 2 tab, 2 ref.

Descriptors: *Telemetry, *Data collections, *Water quality, *Monitoring, *Instrumentation, *New Jersey, Hydrogen ion concentration, Electrical conductance, Water temperature, Oxidation-reduction potential, Dissolved oxygen, Turbidity, Chlorides, Fluorides.
Identifiers: *Water quality sensors.

The automatic stream quality sensing network in New Jersey consists of ten stations located throughout the state. Four stations have two-parameter sensing units. The remaining stations are equipped with five-parameter units. Two of the five-parameter units are located at river confluences so that one instrument can record the water quality of two streams. The two-parameter unit measures specific conductance and water temperature. The package consists of a Fisher Porter automatic digital recorder (ADR), a Chelsea timer, a Beckman servo-programmer, and two sensors. The five-parameter unit measures specific conductance, water temperature, pH, turbidity, and dissolved oxygen. (See also W71-08550) (Knapp-USGS)

ERRORS TO AVOID IN WATER QUALITY COLLECTION AND SAMPLING,
Bureau of Reclamation, Sacramento, Calif.
Melvin Douglas Ball.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 283-292, 1970. 10 p.

Descriptors: *Data collections, *Sampling, *Water quality, Monitoring, Data processing, Planning, Design, Hydrologic data, On-site tests, Analytical techniques, Calibrations, Instrumentation, Data storage and retrieval.
Identifiers: *Water quality data.

The collection of valid data from representative sampling sites is essential for every water quality data collection program. Time and effort spent collecting invalid or nonrepresentative data is wasted. Numerous environmental factors such as prevailing winds, flows, stratifications, water depths, waste discharges, tides, confluence of tributaries, seasons, and time of year must be examined and considered in the selection of sampling locations. Cross-sectional measurements should be conducted to determine the most representative sites. The special precautions required in collecting devices, containers, preservatives, and storage procedures used are reviewed. Instruments must always be properly calibrated, sufficiently powered, and used correctly. (See also W71-08550) (Knapp-USGS)
W71-08878

ERRORS TO AVOID IN COLLECTION AND SAMPLING,
Interstate Sanitation Commission, New York.
Thomas R. Glenn, Jr.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 293-298, 1970. 6 p.

Descriptors: *Data collections, *Sampling, *Water quality, Monitoring, Data processing, Planning, Design, Hydrologic data, On-site tests, Analytical techniques, Calibrations, Instrumentation, Data storage and retrieval.
Identifiers: *Water quality data.

When any sampling program is undertaken, it is extremely important that the data be correct. If the data of a regulatory agency is to be used in court, highly experienced lawyers try to discount every procedure and analysis used by the regulatory agency. Therefore, good sampling, collection and analysis practices are a must. It is important that the sample be as homogeneous as is possible and that it be representative of the sampling point. In order to accomplish this, samples should be composited over a period of time to reduce the chance of abnormal instantaneous values. Also, if samples are not analyzed at the sampling site, they should be kept under conditions so as not to change their composition. In the case of BOD, refrigeration is suitable whereas for coliform determination (MPN's) refrigeration is not suitable but immediate planting is necessary. In setting up continuous monitoring equipment, it is important that the readings be representative of the areas and not just the point at which they are taken. Other problems

associated with continuous monitoring are those of calibration and maintenance and the manpower needed to keep the monitors properly maintained. (See also W71-08550) (Knapp-USGS)

HYDROBIOLOGICAL EVALUATION OF STREAM AND NEARSHORE SYSTEMS: FIELD STUDIES,
Michigan State Univ., East Lansing. Inst. of Water Research.
M. E. Stephenson, E. D. Anderson, and R. A. Cole.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 299-309, 1970. 11 p, 3 fig, 1 tab.

Descriptors: *Monitoring, *Water quality, *Bioindicators, Sampling, Michigan, Water pollution effects, Pollutant identification, Thermal pollution, Lake Erie, Plankton, Aquatic life, Ecology, Aquatic environment.
Identifiers: *Water quality monitoring.

Hydrobiological evaluations may be conducted under the assumption that the most representative indicators of changing water quality are functions of the indigenous biological community. These responses may occur as a result of the introduction of foreign biological populations or change in physical and chemical properties. Field investigations were made on four Michigan stream systems and a nearshore environment in western Lake Erie to evaluate the response of these environments to urbanization and agriculture practices. An ecological evaluation of thermal discharge from a fossil fuel power plant at the mouth of the Raisin River in western Lake Erie was initiated in July, 1969. Community components elected to characterize changes are phytoplankton, periphyton, zooplankton, benthos, fish, and waterfowl. The physical and chemical parameters include temperature, oxygen, phosphorus, organic nitrogen, total nitrogen, nitrate, ammonia, organic carbon, and silica. In addition, pesticide analyses are being performed on the fish collected in the biological program. (See also W71-08550) (Knapp-USGS)

A NOTE ON SAMPLING IN WATER QUALITY STUDIES,
Federal Water Quality Administration, Edison, N. J.
Henry P. Shotwell.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 310-312, 1970. 3 p.

Descriptors: *Sampling, *Data collections, *Water quality, *Statistical methods, Estimating, Heterogeneity, Homogeneity, Hydrologic data, Measurement, Reliability, Variability.
Identifiers: *Water quality data.

The type of water sample to be taken, and the proper sample size are discussed. If no advance information is available about the distribution, in the water, of the parameter or variable being studied, then a simple random sample is probably the best type to take. If the body of water being sampled is known to be heterogeneous, and this fact has a bearing on the parameter being studied, then a stratified random sample is indicated. In order to determine proper sample size, the desired confidence coefficient and confidence interval must be specified. In addition, some estimate of the population variance must be obtained, either from past experience or from a pilot study. Specifying a higher coefficient of confidence will also increase the required sample size, other things being equal. (See also W71-08550) (Knapp-USGS)

ON THE ANALYSIS AND USE OF WATER QUALITY DATA,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
L. T. Fan, J. S. Shastry, and L. E. Erickson.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 313-324, 1970. 12 p, 3 fig, 1 tab, 9 ref.

Descriptors: *Data collections, *Water quality, *Statistical methods, *Systems analysis, Time series analysis, Correlation analysis, Frequency analysis.
Identifiers: *Water quality data.

One of the primary reasons for water quality data collection is that of enforcement of water quality standards. Water quality data are also very useful to those investigating the ecology of streams and estuaries. Systems analysis techniques such as parameter estimation and spectral analysis may be used in the analysis of data and construction of models that enable the investigator to better understand the assimilative capacity of the stream and the effect of discharges on stream ecology. Water quality data may be collected continuously, periodically at frequent specified time intervals, or occasionally at infrequent time intervals. Spectral analysis requires a large volume of data at a very small sampling interval. The shortest period that is necessary to resolve determines the sampling interval, and the longest period necessary determines the total record length. (See also W71-08550) (Knapp-USGS)

ORGANIZING A DATA COLLECTION PROGRAM FOR WATER RESOURCES PLANNING, DEVELOPMENT AND MANAGEMENT,
Geological Survey, Washington, D.C.
D. W. Moody.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 325-335, 1970. 11 p, 1 fig, 1 tab, 5 ref.

Descriptors: *Systems analysis, *Data collections, *Sampling, *Monitoring, *Water quality, Statistics, Statistical methods, Planning, Water resources development, Frequency analysis, Mathematical models.
Identifiers: *Water quality data.

This paper examines the type of interaction that should take place between the water resources planner, designer, and manager and the data collector. The design of a data collection program presupposes knowledge of the sensitivity of a particular planning model to variance in the hydrologic input. If this is known, appropriate hydrologic models, analytical techniques, and accuracy requirements can be specified that will define the required sampling program. The data program organizer usually establishes data program objectives and accuracy requirements subjectively either through conversations with the water resources planner or by intuitive reasoning. An alternative approach would require the program organizers to examine different classes of available planning models and their accuracy requirements. (See also W71-08550) (Knapp-USGS)

newly developed minicomputer offers the op-
nity for improvements in water quality data
sition and monitoring. These devices are
ble for use with conventional parametric water
ly monitoring stations and for use with other
complicated process stream analyzers. While
nated data acquisition cannot be compared
tly with historical manual methods, the costs
achieving similar objectives have reached
r orders of magnitude and are roughly com-
le in certain cases. The typical minicomputer
about $10,000, weighs about 50 pounds, and
ies a space of a little more than 2 cubic feet.
e machines provide computing speeds mea-
sured in microseconds and computing and control capabilities equivalent to machines costing ten times as much only a few years ago. This may result in cost-effectiveness improvement of about 800 to 1. (See also W71-08550) (Knapp-USGS)

THE WATER MANAGEMENT INFORMATION SYSTEM (WAMIS),
Spindletop Research, Inc., Lexington, Ky.
James A. Sena.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 430-439, 1970. 10 p, 5 fig.

Descriptors: *Digital computers, *Data processing, *Hydrologic data, *Water quality, *Data collections, Telemetry, Instrumentation, Sampling, Monitoring, Dissolved oxygen, Automation, Electrical conductance, Data storage and retrieval, Water management (Applied), Systems analysis, Mathematical models, Simulation analysis.
Identifiers: *Water quality data.

The Water Management Information System was developed for the Commonwealth of Kentucky with the aid of a grant from the Water Resources Council. The system uses an IBM 360/65 at the University of Kentucky. WAMIS is intended for use primarily by the managers of Kentucky's water resources. In many cases broad indications can be given to even the engineer for such studies as small watershed analyses. The system makes it possible for the manager to identify water-related problems, to evaluate alternative solutions to these problems, and to determine existing or future attributes of data carried in the system concerning a particular location. The data base currently consists of data on population, employment, water demand, and water supply. Provisions were made to include recreation, water quality, and flood control data. EXPERIENCE WITH COMPUTER USE IN MANAGING WATER QUALITY DATA IN THE DELAWARE RIVER BASIN,
Geological Survey, Philadelphia, Pa.
Richard W. Paulson.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 454-467, 1970. 14 p, 8 fig, 2 ref.

Descriptors: *Digital computers, *Data processing, *Hydrologic data, *Water quality, *Data collections, *Delaware River Basin Commission, Telemetry, Instrumentation, Sampling, Monitoring, Dissolved oxygen, Automation, Electrical conductance, Data storage and retrieval, Water management (Applied), Systems analysis, Mathematical models, Simulation analysis.
Identifiers: *Water quality data.

The U.S. Geological Survey's Water Resources Division office in Philadelphia, Pennsylvania, operates a system of eleven water quality monitors in the Delaware River basin. The objective of the system is to continuously monitor the water quality parameters of dissolved oxygen concentration, specific conductance at 25 deg C, temperature, and pH. This paper briefly summarizes the data processing system devised to process, edit, and summarize these water quality monitor data. The objective of this data processing system is to provide water resources agencies in the basin with water quality data in a concise and unable form on a reasonably current basis. The system also makes available, in a computer-compatible format, water quality data for scientific and engineering studies of water resources in the basin. (See also W71-08550) (Knapp-USGS)

BENEFICIAL USES AND PITFALLS OF HISTORICAL WATER-QUALITY DATA,
Geological Survey, Washington, D.C.
Timothy Doak Steele.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 346-363, 1970. 18 p, 3 fig, 5 tab, 4 ref.

Descriptors: *Data collections, *Water quality, *Data processing, Planning, Systems analysis, Statistical methods, Sampling, Statistics.
Identifiers: *Water quality data.

Many water-quality data have been gathered in the past twenty years. Emphasis on data processing and storage often obscures efforts to derive the full benefit of the information. Data analysis is a necessary link between routine computer processing of water-quality data and data evaluation. In evaluation, the information derived from data is tested against the stated or implied objectives of the data-collection program, and alternate indirect methods at reduced cost are sought for providing information fulfilling the objectives that are satisfied directly using actual data. The application of several statistical techniques to the analysis of historical records of streamflow inorganic chemical quality is described. Results from data analysis of numerous records suggest that data-collection activities of inorganic constituents often might be reduced without substantial loss of information, thus allowing funds and manpower to be redirected to the collection and analysis of other types of data. POTENTIAL BENEFITS OF MATHEMATICAL MODELS AND COMPUTERS FOR WATER QUALITY MANAGEMENT PROGRAMS,
New York Univ., N.Y. Dept. of Civil Engineering.
Alvin S. Goodman.
Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis., p 440-453, 1970. 14 p, 1 fig, 48 ref.

Descriptors: *Digital computers, *Data processing, *Hydrologic data, *Water quality, *Data collections, Telemetry, Instrumentation, Sampling, Monitoring, Dissolved oxygen, Automation, Electrical conductance, Data storage and retrieval, Water management (Applied), Systems analysis, Mathematical models, Simulation analysis.
Identifiers: *Water quality data.

For the effective and economic operation of water quality management programs, it is desirable to coordinate manual field and laboratory studies, automatic monitoring, and mathematical model investigations. This paper reviews the problem areas for which the techniques of mathematical modeling are well advanced. The improvement of data collection programs, particularly those involving automatic monitoring should be undertaken through research and application of mathematical methods and the electronic computer. COMPUTERIZED PROGRAMS FOR MICHIGAN'S WATER MANAGEMENT SYSTEM,
Michigan Water Resources Commission, Lansing; and Ernst and Ernst, Detroit, Mich.
Gary E. Guenther, and Stuart Egan.

Proceedings of the National Symposium on Data and Instrumentation for Water Quality Management, Conference of State Sanitary Engineers and Wisconsin University, July 21-23, 1970, Madison, Wis, p 482-489, 1970. 8 p, 5 ref.

Descriptors: *Data storage and retrieval, *Data processing, *Hydrologic data, *Water quality, *Michigan, Digital computers, Data collections, Monitoring, Water pollution control, Water management (Applied).
Identifiers: *Water quality data.

The digital computer eases the solution of several problems in the field of pollution control, particularly those which involve repetitive operations. Two examples of these are the calculation of dissolved oxygen profiles for waste assimilation analyses and the calculation of water surface profiles for flood plain determination. Michigan's programs for water-management systems include: operating reports concerning quality and quantity of effluent or intake; reports of staff visits; reports of staff surveys at which quality and quantity data were collected; reports of property tax exemption status for pollution control devices; reports of annual performance rating; reports of all Commission actions concerning hearings and orders; reports of performance due, such as date of start of construction; and reports of judicial action, such as filing of briefs. NATIONAL REFERENCE LIST OF WATER QUALITY STATIONS-WATER YEAR 1971.
Geological Survey, Washington, D. C. Water Resources Div.

Geological Survey National Reference List of Water Quality Stations, 1971. 825 p, 7 tab, index.

Descriptors: *Water quality, *Surface waters, *Data collections, *United States, *Information retrieval, Reviews, Water chemistry, Chemical properties, Physicochemical properties, Chemical analysis, Water temperature, Sediments, Sampling, Projects, Hydrologic data, Documentation, Data storage and retrieval, Streams, Lakes, Reservoirs, Data processing.
Identifiers: *National reference list, *Water quality stations.

The water-quality stations listed in this volume (1971 water year) are maintained by the U. S. Geological Survey in cooperation with other agencies for the collection of basic data on the chemical, biological, microbiological, and physical characteristics of streams, lakes, and reservoirs in the United States and its territories. The stations are listed in three sections; in alphabetical order by State, in downstream order by part (major drainage basins), and stations that discontinued operations at the end of the previous water year. Data listed for each station consist of: Identification number, latitude and longitude, station name, drainage area, State, county, date established, type of data collected (chemical, sediment, temperature), available discharge records, frequency of smapling, type of project, source of operating funds, number of years the station has been in operation, and the constituents determined by analysis in the laboratory, in the field, or by digital monitor. The data collected from stations on this list may be obtained by writing the U. S. Geological Survey, Water Resources Division, Automatic Data Processing Unit, Washington, D. C. 20242. (Woodard-USGS)

For many years, domestic and industrial wastes have been discharged along the coastal waters of Puerto Rico without adequate treatment in most cases. This report presents data concerning movement of coastal waters along Puerto Rico to better understand the path of pollutants. Model 502 in-situ current direction, temperature, and velocity meters were used during half-moon cycle periods to collect the data. The information can be utilized in further studies using relevant data such as tide tables, tidal current tables, moon phases and wind direction available from airport, industrial and weather bureau information sources. LITERATURE SURVEY: THE USE OF BACTERIA AS INDICATORS OF FAECAL POLLUTION IN WATER,
Council for Scientific and Industrial Research, Pretoria (South Africa). National Inst. for Water Research.
W. O. K. Grabow.
CSIR special Report O/WAT 1, p 1-27, UDC 543.39:628.19. 74 ref.

Descriptors: *Bioindicators, Water quality, control, Coliforms, E. Coli, Enteric bacteria, Pathogenic bacteria, Bacteria, Salmonella, Streptococcus, Analytical techniques, Separation techniques, Sampling, Meus-membrane filters, *Pollutant identification, *Reviews.
Identifiers: *Faecal coliforms.

Study and discussion revealed the fact that although positive tests for certain indicator organisms, such as faecal streptococci and E. coli I. indicate the presence of pollutant at some u specified time in the past, a negative result on tes provides no information whatsoever. Also, positiv results provide no concrete and definite inform tion that the waters from which the organisms we isolated were polluted. Indicator organisms ha been assumed to be always present in faecal mate als, and to die off more slowly than any of t pathogenic bacteria. However, the complexity factors which determine bacterial kinetics is su that generalizing is very dangerous. Each differe situation occasions a different response from d ferent bacteria. Artificial filtration procedures su as chlorination, filtration, and flocculation m remove enough bacteria to allow bacteriologi examination to certify the water as safe to dri even though it was recently polluted. Therefo although indicator organisms are a useful tool casting suspicion on waters which may or may be contaminated, use of indicators alone will determine whether the water is safe. Presence of dicators, should be the signal for more compreh sive investigations. (Lowry-Texas)

This is a review of the uses, sources, distribution, and toxic effects of mercury, and the main emphasis is on man as the distributor and recipient of mercury in the environment. There is a need to pay more attention to the social implications of present use practices and to recycle much more effectively or develop alternatives to present mercury technology. The principal man-made sources of environmental mercury in the U.S. are chlor-alkali plants, smelting operations, and probably the burning of fossil fuels, wheras the principal natural sources are the land mass itself and geothermal processes. Data for 'background' and 'contaminated' situations in air, water, rocks, soils, sediments, sludges, fossil fuels, plants, animals, foods, and man are drawn together and briefly evaluated. Mercury, in whatever form, is potentially exchangeable among the air, land, and water phases, and it is essentially indestructible. 'Abnormal' concentrations of mercury in terrestrial animals appear concomitantly with the introduction of alkylmercury seed dressings in agriculture during the 1940's, but that mercury levels in fish have steadily risen over the past 100 years in parallel with increased industrial activity. Only the highly toxic methylmercury form is found in the flesh of fish. The formation of methylmercury appears to be promoted by bacterial processes occuring within contaminated bottom sediments, and such sediments can slowly release their mercury burden as methylmercury for many years to come. Alkylmercurials primarily affect neurological processes because of their ability to cross the blood-brain barrier, and they appear to be several orders of magnitude more toxic than other mercury compounds. Mercury vapor is intermediate between the alkylmercurials and other mercury compounds in its effects. Pronounced toxicity is due to lengthy retention by the body. No effective antidote is presently available for these compounds. The criteria for mercury levels are based almost entirely on relatively short-term effects. Tentative standards and guidelines have been set by several organizations and U.S. Government agencies for mercury in air, drinking water, and food. Appendices are included which consider aspects of the physical and chemical properties of mercury.

SEA-WATER INTRUSION: BOLSA-SUNSET AREA, ORANGE COUNTY,
California Dept. State of Water Resources, Sacramento.
John R. Cummings, and Chester A. Carville.
California Department of Water Resources Bulletin No 63-2, Jan 1968. 167 p, 14 fig, 14 plate, 16 tab, 42 ref.

Descriptors: *Saline water intrusion, *Aquifers, *California, Groundwater movement, Path of pollutants, Withdrawal, Chlorides, Salinity, Sea water, Connate water, Aquicludes, Faults (Geology), Hydrogeology, Recharge.
Identifiers: *Orange County (Calif).

The Bolsa-Sunset area, a 6.8-mile-long strip of alluvial-tidal flats and low structural hills and mesas, comprises 55% of the Pacific shoreline of the 330-square-mile coastal plain of Orange County, California. Fresh confined groundwaters containing less than 50 ppm chloride occur in moderately to highly permeable early Recent, Pleistocene, and upper Pliocene sand and gravel aquifers landward of the active Newport-Inglewood fault. The fault, located 3,000 to 5,500 feet inland from and approximately parallel to the coast, forms a variable watertight hydraulic barrier across the area, except in late Recent deposits. Pumping of fresh groundwater in excess of recharge caused a 1945-57 decline of inland piezometric levels to elevations of 30 and 50 feet below sea level in the upper aquifers and in the Main aquifer, respectively. Inland and downward head differentials caused intrusion of saline groundwaters through permeable portions of the fault barrier and through discontinuities in the upper aquiclude. Artificial recharge to the basin forebay and a partial reduction in pumping caused a recovery of piezometric levels during 1959-65. Freshwater heads reached sea level in late 1964 and seasonal artesian flow has existed since. Ion concentrations of groundwaters degraded by sea water intrusion, oil field brines and semiperched water have decreased from peak limits reached in 1961-62. Intrusion and brine wedges have retreated or have become stabilized. (Knapp-USGS)

SYMPOSIUM ON MULTIPLE-SOURCE URBAN DIFFUSION MODELS.

Arthur C. Stern, editor. For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $1.75. Proceedings of Symposium on Multiple-Source Urban Diffusion Models, Oct 27-30, 1969, North Carolina University: US Environmental Protection Agency, Air Pollution Control Office Publication No AP-86, 1970. 401 p.

Descriptors: *Air pollution, *Cities, *Atmosphere, *Path of pollutants, *Diffusion, Air-earth interfaces, Meteorology, Air circulation, Mass, Energy Vapor pressure, Pollutants, Model studies, Equations, Advection, Convection, Tracers, Synoptic analysis, Reviews.
Identifiers: *Symposium (Air pollution).

This symposium concerning air pollution in urban surroundings was conducted by the Meteorology Division of the National Air Pollution Control Administration (NAPCA) and the Department of Environmental Sciences and Engineering, School of Public Health, University of North Carolina at Chapel Hill (UNC), Oct. 27-30, 1969. The papers presented during the symposium are contained in this volume and include (1) Diffusion Modeling for Urban Air Pollution Abatement and Control; (2) Physical and Meteorological Basis for Mathematical Models of Urban Diffusion Processes; (3) Prediction of Diffusion over an Urban-Area--Current Practice and Future Prospects; (4) Some Miscellaneous Aspects of Current Urban Pollution Models; (5) Development of a Practical, Multi-purpose Urban Diffusion Model for Carbon Monoxide; (6) An Urban Atmospheric Dispersion Model, (7) Sensitivities of Air Quality Prediction to Input Errors and Uncertainties; (8) Elevation of Tracer Cloud over an Urban Area; (9) Numerical Simulation of the Temporal and Spatial Distributions of Urban Air Pollution Concentration; (10) A Model of Diffusion in Urban Atmospheres: SO2 in Greater New York; and (11) Analysis of Multiple-Station Urban Air Sampling Data. MERCURY CONTENT OF VARIOUS BOTTOM SEDIMENTS, SEWAGE TREATMENT PLANT EFFLUENTS AND WATER SUPPLIES IN WISCONSIN (A PRELIMINARY REPORT),
Wisconsin Dept. of Natural Resources, Madison.
John G. Konrad.
Research Report 74, 1971. 16 p, 7 fig, 10 tab, 7 ref.

Descriptors: *Heavy metals, *Water pollution sources, *Sediments, *Stream pollution, *Hydrogen ion concentration, *Pulp wastes,

*Chemical wastes, Wisconsin, Effluents, Sewage effluents, Industrial wastes, Waste water disposal, Water pollution, Environmental sanitation, Impaired water quality, Path of pollutants, Public health, Pollution abatement, Water pollution effects, Wisconsin.
Identifiers: *Mercury pollution, Mercury.

Samples were taken from 168 locations in 30 river and stream systems of Wisconsin, and were analyzed by atomic absorption spectrometry. All bottom sediments were found to contain background mercury concentrations of less than 0.01 to 0.35 ppm, depending on the texture of the sediment. High mercury deposits were found below the discharges of the Wyandotte Chemicals Company at Port Edwards on the Wisconsin River and below several pulp and paper mills on the Wisconsin, Chippewa, Flambeau, Wolf, Menominee and Fox Rivers. Accumulations in fish were found to occur where the pH of the water was below 7.5. Significant amounts of mercury were found below several sewage treatment plants which accept mercury-containing wastes. All public surface water supplies sampled contained less than 0.2 ppb mercury. PHYSICAL AND BIOLOGICAL EFFECTS: MILROW EVENT. CHAPTER 4: RADIOACTIVITY,
Nevada Operations Office (AEC), Los Vegas.
M. L. Merritt.
Available from NTIS NVO-79. NVO-79, p 41-8.

Descriptors: *Nuclear explosions, *Water pollution, *Tritium, Groundwater movement, Surface waters, Surface-groundwater relationships, Alaska.

After more than a year, no release of radioactivity from Milrow has been detected. The activity formed remains near the explosion point at 4,000 ft depth. Predictions are made that when the chimney fills with ground water and normal ground water flow patterns are resumed, the flow will be so slow that the tritium concentrations will be reduced below the Radiation Concentration Guide for drinking water for the general public before the tritiated water reaches the ocean. Methods used to measure the release of radioactivity from both Long Shot and Milrow Events on Amchitka Island, Alaska are discussed. (Bopp-ORNL)

Identifiers: *Sardinia, *Italy.

Investigations carried out during the period of 1959-1969 indicated that the hygienic state of the Sardinia coastal waters is generally good if not excellent. The contaminated areas are limited and the degree of pollution is slight and generally due to domestic waste. Careful re-examination of disposal methods could remedy much of the trouble, particularly the aesthetic aspect which is so important to tourist localities. Industrial pollution appears to be more difficult to eliminate and is apt to become more serious. Strict control is necessary in order to preserve the purity of the Sardinian coastal waters, which is still one of the island's most beautiful attractions. (Ensign-PAI)

Descriptors: *Coasts, *Water pollution control, *Pollutant identification, *Industrial wastes, *Municipal wastes, *Water treatment, Treatment facilities, Human population, Waste water disposal, Water pollution sources.
Identifiers: *Italy.

To approximate the pollution situation of the entire Italian seaboard, doctors, scientists, directors of chemical laboratories and sanitation officers of th coastal areas of Italy were consulted. Local sewa purification, the existence of treatment ponds, th presence of industrial pollution, the scope of th polluted areas along the shore and from sho toward high sea, and the eventual disadvantag caused by actual conditions were considered. Co tributing to the situation are ten million inhabitan or 1/5th of the population living along the Itali coast in 300 dwelling centers. Eleven percent urban agglomerations were found to purify th waste waters before disposal. This occurred only in small centers, but in large cities like Ge (880,000) Bari (316,800), Triest (272,00 Reggio-Calabria and others. In some cases wa waters are disposed without any treatment i small streams a few kilometers from the sea. Thi true of Rome, where sewage is discharged in Tibre. Forty-six percent of the coastal areas are posed to industrial pollution. Thirty-two percen these outfalls support some purification treatm of which seventy-five percent are revealed to very unsatisfactory. (Ensign-PAI)

PULP MILL OUTFALL ANALYSIS BY REMOTE SENSING TECHNIQUES,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
Wesley P. James, and Fred J. Burgess.
Journal of the Technical Association of the Pulp and Paper Industry, Vol 54, No 3, March 1971, p 414-418. 6 fig, 2 tab, 6 ref. EPA-WQO Program 16070 ENS.

Descriptors: *Waste water disposal, *Remote sensing, *Aerial photography, *Pulp and paper industry, Industrial waste, Sewage effluents, Oceans, Coasts, Outlets, Mixing, Diffusion, Currents (Water), Water pollution sources, Pollutant identification.

A remote sensing system involving aerial photography was utilized to estimate waste concentrations, water currents, and diffusion coefficients in ocean outfall plumes. Aerial photography of the waste field was taken with a multispectral camera system while boat sampling was conducted to provide 'ground truth' data. Data have been compiled and analyzed by a computerized procedure to relate water quality to photographic imagery. The photographic technique is more comprehensive than conventional boat sampling and permits waste concentrations to be measured throughout the plume in one instant. Discrepancies between concentrations determined by boat sampling and concentrations determined photographically appear to be due primarily to changing and shifting of the waste in this dynamic environment. AN AERIAL PHOTOGRAPHIC STUDY OF WASTE FIELD FROM THREE OCEAN OUTFALLS,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
Wesley P. James, Fred J. Burgess, and Don Baumgartner.
Offshore Technology Conference Proceedings, Houston, Texas April 19-21, 1971., Paper No OTC 1374, p 1483-1498. 17 fig, 4 ref. EPA-WQO Program 16070 ENS.

Descriptors: *Waste water disposal, *Remote sensing, *Aerial photography, *Pulp and paper industry, Industrial waste, Sewage effluents, Oceans, Coasts, Outlets, Mixing, Diffusion, Currents (Water), Water pollution sources, Pollutant identification.

Aerial photography is an effective tool in the study of ocean outfall waste disposal sites. Field studies were conducted on waste plumes from two outfalls in Oregon and one in northern California. Water currents, waste concentrations and diffusion coefficients were determined from the aerial photography. When the hydrography of the receiving water allowed the formation of a surface plume, the water current velocity was found to be the dominant factor in the resulting plume pattern. The steady state form of the Fickian diffusion equation with a unidirectional transport velocity was not applicable to the majority of the observations. (See also W71-08829) (James-Oregon State)

THE USE OF PHOTOGRAMMETRY IN PREDICTING OUTFALL DIFFUSION,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
Wesley P. James, and Fred J. Burgess.
National Council of the Paper Industry for Air and Stream Improvement, Technical Bulletin No 231, December 1969. 26 p, 14 fig, 1 tab. EPA-WQO Program 16070 ENS.

Descriptors: *Waste water disposal, *Remote sensing, *Aerial photography, *Pulp and paper industry, Industrial waste, Sewage effluents, Oceans, Coasts, Outlets, Mixing, Diffusion, Currents (Water), Water pollution sources, Pollutant identification.

Ocean outfalls are in general located in the relatively shallow coastal shelf. In this near-shore area sampling from a boat is impossible much of the time and dangerous at all times. As a result, conventional field study methods can only be used during a short period of the year. Aerial photography overcomes many of these difficulties and offers a possible method for studying dispersion of the waste from existing outfalls or evaluating possible locations for proposed outfalls throughout the year in any sea condition. Photographic techniques also provide a more comprehensive and detailed survey than the conventional procedures. Data collected in a fraction of a second with aerial photography would often require several days of continuous boat sampling. As the tide, wind and currents are continuously changing in outfall area, a survey conducted over an extended period of time does not represent the waste field at any instant but is only a composite of the various plume patterns during that period. MOVEMENT AND RECOVERY OF HERBICIDES IN THE OGALLALA AQUIFER,
Agricultural Research Service, Bushland, Tex. Soil and Water Conservation Research Div.
Arland D. Schneider, Allen F. Wiese, and Ordie R. Jones.
In: The Ogallala Aquifer--A Symposium, Texas Tech University, Lubbock, International Center for Arid and Semi-Arid Land Studies Special Report No 39, p 219-226, 1970. 8 p, 1 fig, 3 tab, 4 ref.

Descriptors: *Path of pollutants, *Groundwater movement, *Injection wells, *Pesticides, Pesticide kinetics, DDT, Coliforms, Permeability, Pesticide removal, Absorption, Herbicides, Insecticides, Water pollution effects.
Identifiers: *Ogallala aquifer (Tex).

During the fall of 1969, water from an irrigation well was used to inject three common herbicides into a dual-purpose well in the Ogallala aquifer at the USDA Southwestern Great Plains Research Center, Bushland, Texas. Then, the well was pumped long enough to recover essentially all of

the recharged water. The dual-purpose well was recharged for 10 days at an average rate of 360 gpm. The herbicides, picloram, atrazine, and trifluralin, were continuously mixed with the recharge water at concentrations that averaged 0.125, 1.28 and 0.24 ppm, respectively. Nitrate, added in the form of sodium nitrate, was used to trace the movement of the recharged water. Water samples pumped from the observation wells at radial distances of 30 and 66 feet from the dual-purpose well showed that all three herbicides moved through the aquifer with the recharged water. The coliform bacteria and DDT were effectively filtered or absorbed by the fine Ogallala sand. (See also W71-08349 thru W71-08357 and W71-08570 thru W71-08575) (Knapp-USGS)

SPARTINA 'DIE-BACK' IN LOUISIANA MARSHLANDS,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
W. G. Smith.
Also published as Louisiana State Univ. Coastal Studies Inst. Technical Report no 91, Dec 1970. Louisiana State University Coastal Studies Bulletin no 5, p 89-96, Feb 1970. 8 p, 2 fig, 13 ref.Contract Nonr 1575 (03), Project ONR, Geog. Progm. Contract GH-47 NSF, Office of Sea Grant Programs.

Descriptors: *Marsh plants, *Tidal marshes, *Soil-water-plant relationships, *Plant pathology, *Louisiana, Saline water, Plant diseases, Tidal waters, Water pollution effects, Hydrogen sulfide, Drainage, Saturated soils.
Identifiers: *Spartina.

'Die-back' is a term applied to degeneration and death of large areas of Spartina townsendii marshes in England. What appears to be the same condition affects S. alterniflora marshes in Louisiana and possibly elsewhere in North America. Several factors that are likely to be involved include (1) excess salinity, (2) pathogenic organisms, (3) lack of available iron, (4) hydrogen sulfide toxicity, (5) change of tidal regime, and (6) pollution. (Woodard-USGS)
W71-08348

RESPIRATION OF AQUATIC MACROPHYTES IN EUTROPHIC ECOSTEMS,
Pennsylvania State Univ., University Parks. Dept. of Civil Engineering.
Archie J. McDonnell, and Dennis W. Weeter.
Available from the National Technical tion Service as PB-199 646, $3.00 in paper copy, $0.95 in microfich. Completion Report, Institute for Research on Land and Water Resources University Parks, Pa, Apr 1971, 74 p, 15 fig, 18 tab, 46 ref. OWRR Project B-016-PA (2).

Descriptors: *Eutrophication, *Aquatic plants, Oxygen, Productivity, *Respiration, Temperature, Nutrients, Dissolved oxygen, *Primary productivity.
Identifiers: Potamogeton crispus, Elodea Canadensis, Respirometers.

Extensive laboratory studies were conducted to evaluate on a seasonal basis the respiratory response of selected aquatic plants to changes in oxygen concentration, temperature, and exogenous nutrient additions. Sampling sites included (1) a nutrient rich stream section which received the effluent from a secondary sewage treatment plant and (2) an unenriched section supported solely by watershed drainage. Test species for the study, which was run in continuous flow and batch type respirometers, included the aquatic macrophytes Potamogeton crispus and Elodea canadensis. Consumption rates were found to be dependent on temperature, state of plant maturity, the oxygen concentration of the test water, and the level of enrichment at the growth site. Values of plant respiration rate at zero dissolved oxygen were observed to vary from 0.21 to 0.87 mg gm to the minus 1 power hr to the minus 1 power with corresponding values of respiration reactivity coefficient ranging from 0.04 to 0.09 lgm to the minus 1 power hr to the minus 1 power. Consumption rates varied from 0.2 to 2.8 mg Osub 2/gm dry weight/hr for dissolved oxygen concentrations of 0 to 18 mg/l. A methodology is presented to estimate primary productivity in aquatic ecosystems from observations of the diurnal variation of dissolved oxygen incorporating a variable community respiration rate.

THE LIMNOLOGY OF HYPEREUTROPHIC LAKE BUTTE DES MORTS, WISCONSIN,
Wisconsin State Univ., Oshosh. Dept. of Biology; and Wisconsin Univ., Madison. Water Resources Center.
William E. Sloey.
Reprint, Proceedings 13th Conference, Great Lakes Research, 1970, 951-968, International Association Great Lakes Research, 1970, 18 p, 11 fig, 50 ref. OWRR Project A-011-WIS (3).

Descriptors: *Eutrophication, *Productivity, *Nutrients, *Lakes, *Phytoplankton, *Influent streams, Dissolved oxygen, Stratification, Limnology, Wisconsin.
Identifiers: *Hypereutrophic, *Winnebago pool, *Shallow reservoir, Nitrate, Phosphate, Melosira granulata, M. Ambigua, Stephanodiscus Hantschii, S. niagarae, *Lake Butte des Morts (Wisc).

Lake Butte des Morts is the mixing basin of the Fox and Wolf Rivers which together comprise the principle influent to Green Bay. The lake is a portion of the larger Winnebago Pool. The water is highly eutrophic--during 1967-68, C-14 productivity of the phytoplankton ranged to 5.2gC/sq m/day and averaged 1227 mgC/sq m/day during the ice-free period. The euphotic zone was only 1.11-1.40 m. Dissolved oxygen decreased to under 3 mg/l in less than 24 hours during temporary stratification. Nitrate ranged to 2.21 mg/l and phosphate to 0.39 mg/l. Suspended solids averaged 25-50 g/m3 during open water and phytoplankton volumes ranged to 110,000,000 cu microns/ml. The predominant phytoplankton were Melosira granulata, M. ambigua, Stephanodiscus Hantschii, S. niagarae, and typical nuisance blue-greens. The lake is presently undergoing a loss of littoral vegetation and should be considered hypereutrophic on the basis of phytoplankton production.

MERCURY ANALYSES AND TOXICITY: A REVIEW,
Teledyne Brown Engineering, Huntsville, Ala. Environmental Sciences; and Carnegie-Mellon Univ., Pittsburgh, Pa.
Robert A. Baker, and Ming-Dean Luh.
Water and Sewage Works, Vol 118, No 5, p IW/2-IW/29, May 1971. 9 p, 67 ref.

Descriptors: *Pollutants, *Heavy metals, *Bibliographies, *Environmental effects, *Water pollution, Air pollution, Reviews, Chemical analysis, Analytical techniques, Path of pollutants, Toxins, Toxicity, Chemical properties, Human pathology, Animal pathology.
Identifiers: *Mercury, Mercury poison, Antidote.

This review summarizes some of the known toxicological effects of mercurials and examines the various analytical procedures used in its identification and quantification. Perhaps the most devastating indictment of mercury pollution is its long-term persistence. The irreversible effects on adults and unborn children are an ever-increasing concern to public health specialists around the world. Treatment of mercury poisoning with 0.001 M solutions of cystein or glutalhione has produced almost instantaneous relief in selected cases. (Woodard-USGS)

NUTRIENT LIMITING FACTORS IN A OLIGOTROPHIC SOUTH CAROLINA POND,
Savannah River Ecology Lab., Aiken, S.C
J. M. Polisini, Claude E. Boyd, and Bonny Didge.
Oikos, Vol 21, No 2, p 344-347, 1970. 4 p, 1 fig, 1 tab, 7 ref. USAEC Contract AT (38-1)-310.

Descriptors: *Oligotropy, *Ponds, *Nutrients, *Bioassay, *South Carolina, Analytical techniques, Nitrates, Phosphates, Sulfates, Calcium, Rain, Sampling, Spectrophotometry, Eutrophication.
Identifiers: *Carbon-14 bioassay, Atomic absorption spectrophotometer.

Several small abandoned farm ponds are located on the U.S. Atomic Energy Commission Savannah River Plant near Aiken, South Carolina. These ponds have not been disturbed by human activity since closure of the reservation in 1952. Nutrient relationships were studied in a small oligotrophic pond. Dissolved nutrient levels were very low and marked seasonal changes in concentrations were not apparent. Rainfall nutrient input was large but comparatively small quantities of nutrients entered the pond in leaf fall. Light and dark bottle productivity estimates were very low. The carbon-14 bioassay technique revealed that sulfate was the only single nutrient capable of increasing primary productivity. Combinations of nitrate and phosphate increased productivity as much as nitrate, phosphate and sulfate. When calcium or potassium was

h these anions an additional increase in carbon- uptake was observed. (Woodard-USGS)

determine the effect of pH on embryonic elopment of Mulinia lateralis, fertilized eggs e placed in polypropylene beakers containing red, ultraviolet-treated sea water (27 plus or us 0.50/parts per thousand). In three experi- ts fertilized eggs were placed in beakers and pH of duplicate cultures was adjusted with HCl NaOH to levels ranging from 5.75 to 9.25 at -unit intervals. Three additional experiments e run to determine the effect of various pH ls on the survival and growth of larvae. Some ryos of Mulinia lateralis developed into normal ae from pH 6.25 to 8.75, but maximum elopment was satisfactory only within the range 7.25 to 8.25, and was highest at 7.75. Some ae survived from pH 5.75 to 9.00, but survival satisfactory only within the range from 6.50 to , and was highest at 7.25 to 7.50. Larvae grew factorily within the pH range from 7.00 to ; pH 7.25 was the optimum for growth. tello-Washington)

Identifiers: *Ciguatera, Caulerpa sp., Caulerpicin, Caulerpin, Palmitic acid, Beta-sitosterol, Thin-layer chromatography.

Alcoholic and ether extracts of obligate herbivores, omnivores and detritus feeders common on Caulerpa or in its communities were sometimes found by thin-layer chromatography to contain varying amounts of caulerpicin, caulerpin, palmitic acid, and beta-sitosterol. Cerithium and soft corals, which may be either omnivorous or carnivorous, on occasion contain caulerpicin. The crustacean detritus feeders did not seem to preserve either caulerpicin or caulerpin. Caulerpicin and caulerpin, which, as produced by Caulerpa are physiologically active and toxic to rats and to mice, are apparently transferred along the food chains and concentrated in at least some herbivores. RECOVERY OF SALT MARSH IN BRITTANY SIXTEEN MONTHS AFTER HEAVY POLLUTION BY OIL,
Nature Conservancy, Norwich (England). Coastal Ecology Research Station.
R. E. Stebbings.
Environmental Pollution, Vol 1, p 163-167, 1970. 3 ref.

Descriptors: *Oily water, *Water pollution effects, *Marshes, *Coastal marshes, *Salt marshes, *Marsh plants, *Soil gases, Oil, Oil wastes, Surveys, Oil-water interfaces, Vegetation establishment, Plant groupings, On-site investigations, On-site data collections, Soil investigations, Tidal marshes, Intertidal area, Water pollution, Soil contamination effects, Aesthetics, Photosynthetic oxygen, Root development.
Identifiers: *Oil spills, Chlorosis, Salicornia sp., Beta sp., Spartina sp.

Oil was stranded at Cotes du Nord, Britanny in April, 1967 after drifting at sea for 14-18 days. The long drift period enabled the more volatile fractions to dissipate before stranding. The effects were observed of the oil on two marshes 14 days thereafter, and again 16 months later. Oil was originally deposited 2-5 cm deep over the marshes with frequent deeper pools to 10 cm. It was viscous and stuck thickly to vegetation. Sixteen months later, most salt marsh plant species survived all but the heaviest contamination, with the exceptions of Salicornia perennis and Beta maritina. Oil appeared to prevent gaseous interchange between soil and air, yielding reducing conditions, leading to chlorosis in plants. Vegetative reinvasion occurred in cracks of drying oil layers. Specification of the type oil involved may have rendered the observations more valuable, but crude oil is assumed in the absence of this detail. (LeGore-Washington)

ACCUMULATION OF DDT RESIDUES IN TRIPHOTURUS MEXICANUS FROM THE GULF OF CALIFORNIA,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
James L. Cox.
Nature. Vol 227, No 5254, p 192-193, July 11, 1970. 1 fig, 1 tab, 11 ref. NSF Grant.

Descriptors: *DDT, *Gas chromatography, *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Fish physiology, Water pollution effects, Diffusion, Fish food organisms, Food chains, Path of pollutants.
Identifiers: *DDE, Triphoturus sp., Concentration, Biological concentration, Fish gills, Gulf of California.

In an attempt to obtain size-class data about concentrations of pesticide residues, relatively free of pesticide 'hot spots,' Triphoturus mexicanus, a midwater fish from an area remote from areas of pesticide application, was chosen for analysis by gas chromatography. DDT concentrations ranged from 13 to 79 ppb. The controversy concerning the importance of diffusive loss of pesticide residues across gill membranes is discussed. An increase in total residue and DDE concentrations with fish body weight was found. This evidence tends to minimize the importance of residue loss by diffusion, because no apparent equilibrium is established. (LeGore-Washington)

STUDIES ON ACCUMULATION OF HEAVY METALS IN AQUATIC ORGANISMS--IV. ON DISAPPEARANCE OF ABNORMALLY ACCUMULATED COPPER AND ZINC IN OYSTERS. (IN JAPANESE),
Miyazaki Univ., Miyazaki (Japan). Faculty of Agriculture.
Ikuta Kunio.
English summary. Bulletin of the Japanese Society of Scientific Fisheries, Vol 34, No 6, p 482-487, June 1968. 7 fig, 3 tab, 8 ref.

Descriptors: *Heavy metals, *Copper, *Oysters, *Public health, *Self-purification, Metals, Water pollution effects, Shellfish, Mollusks, Bioassay, Environmental sanitation, Human diseases.
Identifiers: *Zinc, *Depuration, Japan.

Oysters containing abnormally high levels of copper and zinc were transplanted to a normal oyster growing area, and depuration of the metals was observed. Excretion of the accumulated Cu does not begin until two weeks or longer after transplantation, while the Zn begins to disappear immediately. Once begun, however, Cu levels decrease at greater than twice the rate that Zn is eliminated. The metal contents of the oysters and the Zn:Cu ratio fell to normal within 116 days. (LeGore-Washington)

DYNAMICS OF ENDRIN UPTAKE AND RELEASE BY RESISTANT AND SUSCEPTIBLE STRAINS OF MOSQUITOFISH,
Mississippi State Univ., State College. Dept. of Zoology.
Denzel E. Ferguson, J. Larry Ludke, and George G. Murphy.
Transactions of the American Fisheries Society, Vol 95, No 4, p 335-344, Oct 1966. 8 tab, 17 ref. PHS Grant No ES 00086-01.

Descriptors: *Water pollution effects, *Endrin, *Pesticide toxicity, *Chlorinated hydrocarbon pesticides, *Resistance, Pesticide residues, Absorption, Bioassay, Fish physiology, Mortality, Pollutants, Water pollution sources, Lethal limit, Poisons, Toxins, Toxicity, Fish diseases, Fishkill, Runoff.
Identifiers: *Mosquitofish, *Gambusia sp., TL-m, Farm runoff, Cotton fields.

Laboratory bioassays indicated that mosquitofish, Gambusia affinis, from near heavily-treated cotton fields (36 hr TL-m — 1,000 ppb) and from an uncontaminated site (36 hr TL-m — 1 ppb) remove endrin from static test solutions at the same rate. A 500 ppb endrin solution produced 32% mortality in 50 susceptible fish in 25 min, but required 144 hr in resistant fish. About six times as much endrin is taken up via the exposed head region as is taken up by the general body surfaces. Oxygen requirements

of the two populations are similar, but increase for susceptible fish at low endrin concentrations, and for resistant fish at high concentration coincident with the appearance of symptoms of endrin poisoning. A single resistant female, exposed to 1,000 ppb endrin, released sufficient endrin in 10 liters of water to kill five susceptible fish in 38.5 hr and survived the experience. The mechanism of resistance is physiological toleration of massive endrin accumulations, but is is not known how the toxic effects of endrin are avoided. (LeGore-Washington)

FISH KILL CAUSED BY AN INTERMEDIATE OIL FROM COKE OVENS,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
V. Zitko, and S. N. Tibbo.
Bulletin of Environmental Contamination and Toxicology, Vol 6, No 1, p 24-25, 1971. 1 ref.

Descriptors: *Oil, *Fishkill, *Mortality, *Water pollution effects, *Herrings, *Lethal limit, *Fish toxins, *Toxicity, Oily water, Oil wastes, Fish physiology, Fish diseases, Chromatography, Bioassay.
Identifiers: *Oil pollution, Coke, Coke production.

A mass mortality of herring occurred in North Sydney Harbor, Nova Scotia, Canada in April, 1969. Dead fish were examined, and skin muscle and intestines were found to contain, respectively, 17.5, 5.2 and 9.2 ug of the suspected oil per gram wet weight. Bioassays indicated LT-50 values (time to 50% mortality in hours) of 0.25, 0.87, 3.7 and 93.0 at 100, 10, 8 and 6 ppm of oil, respectively. The detection of the oil in dead herring and the high toxicity of the oil to herring under laboratory conditions indicate that this intermediate oil caused the fish kill. The distribution of the oil in the tissues shows that the oil was taken up primarily through the body surface. (LeGore-Washington)

MERCURY LEVELS IN FISH FROM SELECTED WISCONSIN WATERS (A PRELIMINARY REPORT),
Wisconsin Dept. of Natural Resources, Madison.
Stanton J. Kleinert, and Paul E. Degurse.
Research Report 73, 1971. 16 p, 1 fig, 3 tab, 15 ref.

Descriptors: *Heavy metals, *Stream pollution, *Path of pollutants, *Public health, Wisconsin, Industrial wastes, Environmental sanitation, Water pollutioneffects, Pulp wastes, Chemical wastes, Walleye, Suckers, Catfishes, Sunfishes, Yellow perch, Fish, Fish physiology, Lake Michigan, Lake Superior, Mississippi River.
Identifiers: *Mercury pollution, *Bioconcentration, Concentration, Mercury, Redhorse fish, Crappie, Green Bay Wisconsin.

Mercury determinations were made on fish filet samples from throughout Wisconsin and from Wisconsin's boundary waters of Lake Michigan, Green Bay, Lake Superior and the Mississippi River. All Wisconsin fish analyzed contained some mercury, with a range of 0.01 to 0.60 ppm, and an average of 0.19 ppm. The highest mercury levels, averaging 0.80 ppm, and ranging from 0.06 to 4.62 ppm, occurred in fish taken from below paper mills and from below a mercury cell chlor-alkali plant. Different species vary in mercury content, and the larger fish often contain higher concentrations than do smaller fish of the same species taken from the same water. Walleye, sucker, redhorse, crappie and bullhead frequently showed higher mercury concentrations, while the panfishes showed lower concentrations. It is essential, therefore, that mercury levels in all important species in the fishery be determined before the potential pollution problem can be adequately assessed. (LeGore-Washington)

INFLUENCES OF HIGH TEMPERATURE AND RESIDUAL CHLORINE ON THE MARINE PLANKTONIC LARVAE (IN JAPANESE),
Nagasaki Univ., (Japan). Faculty of Fisheries.
Kazutsugu Hirayama, and Reijiro Hirano.
English summary. Bulletin of the Faculty of Fisheries, Nagasaki University, No 29, p 83-89, Aug 1970. 1 fig, 4 tab, 4 ref.

Descriptors: *Chlorination, *Lethal limit, *Thermal pollution, *Water pollution effects, *Larvae, *Heat resistance, Chlorine, Poisons, Toxicity, Bioassay, Heated water, Water temperature, Water utilization, Oysters, Mortality, Cooling water.
Identifiers: TL-m, Crassostrea gigas, Mytilus edulis, Balanus sp., Anthocidaris sp., Sea urchins, Barnacles.

Some biological effects of brief exposure to high temperature and to dissolved chlorine were determined to simulate the environmental danger presented by use of industrial cooling water. Temperature bioassays were conducted against 2-4 cell, blastula and pluteus stages of the sea urchin (Anthocidaris crassipina), against nauplii of the rock barnacle (Balanus amphitrite albicostatus), and against the blastula stage of the oyster (Crassostrea gigas). Trochophore and 2-4 cell larvae of the mussel, Mytilus edulis, were exposed to the chlorine. Young sea urchin larvae are least tolerant to heat, being unable to survive a 20 min exposure to 33 C. Nauplius II barnacle larvae are most tolerant, surviving a 40 min treatment at 40 C. The 10 min TL-m values for 2-4 cell and for trochphore mussel larvae are 1.15 and 1.31 ppm, chlorine in water, respectively. The 5 min TL-m increased from 1.21 ppm chlorine for 2-4 cell mussels to 2.37 ppm chlorine for trochophore mussel larvae. (LeGore-Washington)

INFLUENCES OF HIGH TEMPERATURE AND RESIDUAL CHLORINE ON MARINE PHYTOPLANKTON,
Nagasaki Univ., (Japan). Faculty of Fisheries; and
Tokyo Univ., (Japan). Faculty of Agriculture.
K. Hirayama, and R. Hirano.
Marine Biology, Vol 7, No 3, p 205-213, Nov 1970. 10 fig, 5 tab, 3 ref.

Descriptors: *Chlorination, *Lethal limit, *Thermal pollution, *Water pollution effects, *Chlamydomonas, *Heat resistance, Chlorine, Poisons, Toxicity, Bioassay, Heated water, Water temperature, Water utilization, Mortality, Cooling water, Photosynthesis, Primary productivity, Phytoplankton, Inhibition, Resistance.
Identifiers: *Skeletonema sp., *Photosynthetic inhibition, Temperature shock, Acute exposure.

The direct influence of high temperature and residual clorine on growth and photosynthesis of Chlamydomonas sp. and Skeletonema costatum were investigated experimentally. Chlamydomonas sp. and S. costatum exposed to high temperatures were affected in their growth from 43 C and 35 C respectively, by immersion of the respective cultures in a warm bath for 10 min. Exposure to high temperatures of 40 C and 34-35 C for 10 min influenced their photosynthetic activities, which were completely inhibited immediately after 10 min exposure to 42 C and 37 C, respectively. S. costatum was killed by chlorine at a concentration of 1.5-2.3 ppm when exposed for either 5 or 10 min, while Chlamydomonas sp. was not irreversibly damaged even at 20 ppm chlorine or more with the same exposure period. The high temperature and residual chlorine in, effluents from a power plant discharging into the open sea, should cause great damage to marine phytoplankton in that area. (LeGore-Washington)

CHRONIC TOXICITY, UPTAKE, AND RETENTION OF AROCLOR 1254 IN ESTUARINE FISHES.
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Lab.
D. J. Hansen, P. R. Parrish, J. I. Lowe, A. J. Wilson, Jr., and P. D. Wilson.
Gulf Breeze Contribution No 120. Bulletin of Environmental Contamination and Toxicology, Vol 6, No 2, p 113-119, 1971. 2 tab, 11 ref.

Descriptors: *Water pollution effects, *Pesticides, *Bioassay, *Chlorinated hydrocarbon pesticides, DDT, Mortality, Poisons, Gas chromatography, Lethal limit, Laboratory tests.
Identifiers: *Polychlorinated biphenyls, *Aroclor 1254, *Chronic exposure, PCB, Lagodon rhomboides, Leiostomus sp., Long-term bioassay, Pinfish, Spot (Fish).

Some effects of the polychlorinated biphenyl (PCB) mixture, Aroclor 1254 (Monsanto Co, St. Louis, Mo.), on the pinfish (Lagodon rhomboides) and the spot (Leiostomus xanthurus) were determined in laboratory bioassay. Previous work indicated that PCB is not acutely toxic to juvenile pinfish. This work indicates, however, that both species of fish died (41-66% mortality) when exposed for 14-45 days to 5 ppb of Aroclor 1254. Spot appeared unaffected by 1.0 ppb for up to 45 days. Chronic exposure to Aroclor 1254 appeared to increased susceptibility of test pinfish and spot to disease, and also appeared toxic. This PCB was rapidly stored by these fish, and persists in tissues for about three months. (LeGore-Washington)

POTENTIAL TOXICITY OF KRAFT MILL EFFLUENT AFTER OCEANIC DISCHARGE,
Oregon State Univ., Corvallis. Engineering Experiment Station; and Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
Robert C. Courtright, and Carl E. Bond.
The Progressive Fish Culturist, Vol 31, No 4, p 207-212, Oct 1969. 5 fig, 3 tab, 6 ref. FWPCA Grant no WP-524.

Descriptors: Pulp wastes, *Water pollution effects, *Toxicity, *Sculpins, *Lethal limit, Marine fish, Mussels, Bioassay, Resistance, Pulp and paper industry, Industrial wastes.
Identifiers: *Kraft mill effluents, *Foam, Fluffy sculpins, TL-m, Median tolerance limits.

Toxicity bioassays were conducted with the marine species, fluffy sculpin, and the larvae of mussels to determine the toxicity of foamed kraft mill effluent. The foamed effluent was five times more toxic than the whole waste before discharge into the salt water. The sculpins can survive in toxic concentrations for a longer period in cool water (16 C) than in warm water (28 C). The 64 hr median tolerance limit (TL-m) at 18 and 30 parts per thousand salinity was about 9% of the kraft mill effluent foam. (Katz-Washington)

STUDIES OF THE NATURAL ALPHA-EMITTING RADIOISOTOPES IN MARINE ORGANISMS,
Washington, Univ., Seattle.
Thomas M. Beasley.
Available from NTIS RLO-2225-F-14-1. RLO-2225-T-14-1, Dec 1970. 46 p, 1 fig, 7 tab, 50 ref. AEC Contract AT (45-1)-2225.

Descriptors: *Radioisotopes, *Absorption, *Aquatic population, *Lead radioisotopes, Zooplankton, Crustacean, Benthic fauna, Bottom fish, Saline water fish, Brackish-water fish, Freshwater fish, Trace elements.
Identifiers: *Polonium radioisotopes, Iron radioisotopes.

Tissues from organisms (zooplankton, pelagic fishes, and benethic organisms) were analyzed for polonium-210, lead-210, and stable lead. Polonium-210 increased from codepods to euphausiids and from mysids to pelagic fishes, but lead-210 decreased through the same chain. Polonium-210 was lowest in late spring and summer. Although levels were not considered toxic in fish protein concentrates, ingestion of normal amounts would substantially increase dietary levels of polonium-210, lead-210, cobalt and lead. The increase in uptake would be less important for silver, cadmium, copper, iron, zinc, and manganese. Blood from residents of Rongelap Atoll showed unusually high body burdens of iron-55. TRANSFER OF TRITIUM TO MAN FROM AN INITIAL WET DEPOSITION,
Oak Ridge National Lab., Tenn.
M. J. Kelly, and R. S. Booth.
Available from NTIS ORNL-TM-3134. ORNL-TM-3134, Jan 1971. 22 p, 8 fig, 5 ref. AEC Contract W-7405-eng-26.

Descriptors: *Tritium, *Soil contamination effects, *Nuclear explosions, Rainout, Food and cover crops, Radioactivity effects, Potable water, Rainfall, Soil water movement.

The total dose to man was estimated from a given wet deposition of tritium taking into account subsequent rainfall which tends to decrease the dose by dispersing the tritium deep into the soil. Except for the desert, the time-dependent concentration of tritium in soil is primarily determined by the rainfall after deposition and is nearly independent of the assumed depth of the soil compartment. A mathematical model was employed which was tested qualitatively against experimental results. (Bopp-ORNL)

ECOLOGY OF ANIMAL COMMUNITIES,
Johns Hopkins Univ., Baltimore, Md. School of Hygiene and Public Health.
Brenda K. Sladen.
IN: Biology of Populations, The Biological Basis of Public Health, New York, American Elsevier Publishing Co., 1969, p 87-100.

Descriptors: *Radioecology, *Aquatic populations, *Strontium radioisotopes, Productivity, Food webs, Life cycles, Lakes, Cycling nutrients, Energy transfer.

Accumulation of radionuclides demonstrated aquatic animal community interrelationships. A Canadian lake contained radionuclides seeping from a liquid waste disposal area. Biological activity during the warmer months depleted the nuclide levels. Strontium-90 in perch bones reached a constant after 5 years, and after 2 years or less in shorter lived animals. Cycling from species to species was followed. Strontium-90 concentration was 3,000 to 3,500 times greater in perch and muskrat bones than in water. Ecological concepts which are considered include succession, cycling, energy flow, and food webs. (Bopp-ORNL)

ANNUAL REPORT FOR 1970 TO THE USAEC, DIVISION OF BIOLOGY AND MEDICINE, VOLUME 1 LIFE SCIENCES, PART 2 ECOLOGICAL SCIENCES.
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.

Available from NTIS BNWL-1550 (Vol) (Pt 2). BNWL-1550, Vol. I, Part 2, Mar 1971. About 110 p. UC-48, Biology and Medicine.

Descriptors: *Ecology, *Environmental effects, *Radioactivity effects, Thermal stress, Nuclear powerplants, Tritium, Zinc radioisotopes, Strontium radioisotopes, Cesium, Soils, Predation, Food chains, Columbia River, Deserts, Arctic, Soils, Biota.

Identifiers: Cesium radioisotopes.

Characterization of functional roles and responses to disturbances of plants and animals is emphasized in the terrestrial program. The ALE Reserve, Alaska, Antartica, and both riparian and dessert communities near Hansford are included in the environments being studied. Determination of effects of man-made stress on aquatic environments is emphasized in the aquatic program. The effects of thermal increments and radiation are delineated and predicted. Base line studies on primary productivity, growth, and rates of transfer of essential elements are important for measurement of the sublethal effects of these stress factors. ECOLOGIC CHARACTERISTICS OF THE COLUMBIA RIVER. FRESHWATER ECOLOGY OF RATTLESNAKE SPRINGS. RATES AND MECHANISMS OF BIOGEOCHEMICAL PROCESSES OF THE COLUMBIA RIVER,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
R. E. Wildung, R. L. Schmidt, C. E. Cushing, C. D. Becker, and D. G. Watson.
BNWL-1550, Vol. I, Part 2, Mar 1971, p 2.1-2.10, 2 fig, 3 tab, 9 ref.

Descriptors: *Suspended load, *Aquatic productivity, *Bioassy, *Radioactivity effects, Zinc radioisotopes, Periphyton, Freshwater fish, Cycling nutrients, Food web, Chemical analysis, Dissolved oxygen, Carbon dioxide, Hydrogen ion concentration, Thermal stress, Columbia River, Biota, Cation adsorption, Montmorillonite, Illite, Silicates, Primary productivity.

Transfer rates of radionuclides and stable elements are being investigated in aquatic systems. Several related aspects of primary productivity are being studied, for example, in relation to soil particle-water exchanges, and in relation to plant and animal structure in the ALE Rexerve ecosystem. An understanding of the interaction between water, suspended materials, and the biota is necessary because thermal stress effects, for example on the periphyton community, can ultimately affect fish. FIXATION AND LONG-TERM ACCUMULATION OF TRITIUM IN AN EXPERIMENTAL AQUATIC ENVIRONMENT AND EFFECTS OF SHORT RANGE PARTICLE IRRADIATION ON EMBRYOGENESIS OF MARINE TELEOST FISH,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
J. A. Strand, W. L. Templeton, E. G. Tangen, and P. A. Olson.
BNWL-1550, Vol. I, Part 2, Mar 1971, p 2.36-2.40, 2 fig, 1 tab.

Descriptors: *Tritium, *Embryonic growth stage, *Marine fish, Nuclear powerplant, Food web, Aquatic environment, Absorption, Water pollution, Environmental effects, Radioactivity effects, Water pollution effects.

Tritium as tritiated water will be a major contributor to the radioactivity in the effluents from nuclear power plants, and it cannot be removed by conventional technology. Two new research programs were initiated to determine the ultimate concentration in and its effect upon segments of the aquatic ecosystem. Experiments on the aquatic food web have just commenced, in which tritiated water is introduced into an ecosystem at a concentration of 1.0 microCi/l. In the other groups of experiments, preliminary consideration of data indicates no significant degree of detriment in embryogenesis, as resulting from exposure to levels of 0.01, 0.1 and 1.0 microCi/ml of tritium. However the present effort treats only a portion of the early life stages. Longer term studies will be necessary to investigate the problem fully, to examine first embryonic mitosis (four-cell blastomere stage), and to examine time of reabsorption of yolk sac. W71-08659

THE ECOLOGY OF THE SECOND TROPHIC LEVEL IN LAKES SUPERIOR, MICHIGAN AND HURON,
Minnesota Univ., Minneapolis. School of Public Health.
W. R. Swain, T. A. Olson, and T. O. Odlaug.
Available from the National Technical Information Service as PB-199 938, $3.00 in paper copy, $0.95 in microfiche. Minnesota Water Resources Research Center, Bulletin 26, Oct 1970. 151 p, 95 fig, 43 tab, 85 ref. OWRR Project A-011-MINN (10).

Descriptors: *Tropic level, *Lake Superior, *Lake Michigan, *Lake Huron, *Plankton, Ecology, Zooplankton, *Eutrophication, Organisms, Aquatic environment, Limnology, Vertical migration, Biogeography, Phytoplankton, Crustaceans.
Identifiers: *Continuous plankton recorder, Multi-depth plankton indicator, Two-net technique, Grit gauze, Silk bolting cloth.

A series of lake-long transect tows were made with the Continuous Plankton Recorder in Lakes Superior, Michigan and Huron, 1966-68. All tows were made at ten meters depth with either no. 60 mesh Grit Gauze or no. 15 mesh Silk Bolting cloth. Information was obtained on organism distribution in both space and time. The density and distribution of ecologically related groups in plankton indicate the relative tropic status of the bodies of water sampled. Lake Superior is the most oligotrophic, Lake Huron the most eutrophic and Lake Michigan more mesotrophic. A mean of 200 to 300 organisms per section was seen in Lake Superior; a range of 5,000 to 6,000 organisms per section was seen in Lake Michigan and from 20,000 to 21,000 organisms were observed from one year to another and from one season to another. Marked variations in both numbers and species of organisms were evident in the lakes. Limitations of the Continuous Plankton Recorder method are described. (Walton-Minnesota)

LAKE MINNETONKA: NUTRIENTS, NUTRIENT ABATEMENT, AND THE PHOTOSYNTHETIC SYSTEM OF THE PHTOPLANKTON,
Minnesota Univ., Minneapolis. Limnological Research Center.
Robert O. Megard.
Available from the National Technical Information Service as PB-199 915, $3.00 in paper copy, $0.95 in microfiche. Final Report, Dec 1970. 210 p, 21 fig, 10 tab, 41 ref, 3 append. OWRR Project A-016-MINN (4).

Descriptors: *Limnology, *Lakes, *Photosynthesis, *Phytoplankton, *Productivity, Algae, Nitrogen, Phosphorus, Mathematical models, Nutrients, Measurement, Population, Chlorophyll, Water pollution effects, Temperature, Carbon, Diatoms, Light, Oxygen, Minnesota.
Identifiers: *Lake Minnetonka (Minn).

Density of planktonic algae, rates of photosynthesis, nutrient concentrations, and other limnological characteristics were recoded during 1968-1970 in different parts of Lake Minnetonka, Minn. In the course of the past 30 years, the density of algae increased 2 or 3 times, and the dominance of diatoms was replaced by that of blue-green algae. A linear relationship was disclosed between the algae dens
ty and the content of total phosphorus within th
range of 50 to 200 mg/cu m. A decrease
phosphorus below 45 mg/cu m promises a rapid in
provement of the lake quality. The nutrient e
richment of the lake is largely due to the land r
noff and storm drainage, rather than the dischar
of sewage. A mathematical model of t
photosynthetic system was based on the relati
between the intensity of illumination and t
biomass of algae. The report includes a detail
record to taxa and densities of algae during d
ferent months of 1968 and 1969. (Wilde-Wisco
sin)

LOSSES OF MINERAL NUTRIENTS DURIN DECOMPOSITION OF TYPHA LATIFOLIA,
Savannah River Ecology Lab., Aiken, S.C.
Claude E. Boyd.
Archiv fur Hydrobiologie, Vol 66, No 4, p 511-5
1970. 4 fig, 1 tab, 11 ref.

Descriptors: *Aquatic plants, *Nutrients, *So
bility, Plant physiology, Degradation (Decomp
tion), Leaching, Eutrophication, Analysis, So
Carolina.
Identifiers: Typha latifolia, Par Pond (SC), Sav
nah River (SC).

Samples of Typha latifolia were placed into t
bags of fiberglass netting, and either suspende
cm above the water, or anchored on the surfac
the mud at a depth of 30 cm. The tissues in
merged bags showed a more rapid loss of dry
ganic matter than the suspended tissues; the de
mination of nitrogen, phosphorus, calcium,
nesium, potassium and sodium in plant tissue
dicated a more rapid return of nutrients to the
vironment from the submerged plants, acc
plished by microbial mineralization as wel
leaching; the latter was particularly conspicuo
the loss of monovalent bases. Aquatic macrop
decompose more rapidly than terrestrial plants
ing initial decay stages. (Wilde-Wisconsin)

BSERVATIONS ON THE SMALL-SCALE DIS-RIBUTION OF ESTUARINE PHYTOPLANK-ON,
aine Univ., Walpole. Ira C. Darling Center for esearch; and Maine Univ., Walpole. Dept. of ology.
J. McAlice.
arine Biology, Vol 7, No 2, p 100-111, 1970. 4 , 12 tab, 30 ref.

escriptors: *Phytoplankton, *Estuaries, *Dis-bution, Spatial distribution, Distribution pat-ns, Rhode Island, Maine, Population, Density, tistical methods.
ntifiers: *Phytoplankton patches, Asterionella onica, Chaetoceros laciniosus, Skeletonema statum, Ditylum brightwelli, Rhizolinia delicatu-Rhizosolenia setigera, Rhizosolenia fragilissima, alassiosira nordenskioldii, Thalassiosira cipiens, Thalassiosira gravida, Leptocylindrus nicus, Nitzschia seriata, Guinardia flaccida, iatella unipunctata, Prorecentrum triangulatum, ridinium triquetrum, Peridinium trochoideum, sthodiscus luteus, Narrangansett Bay (RI), mariscotta River (Me), Thalassionema zschioides.

pulation densities of phytoplankton were studied collections of eight series comprising 94 in-idual collections. Density differences were nonstrated by analyses of variance in the series en the collecting interval was more than 10 cm. tistically significant differences in the popula-n densities of individual species were found in st collection series. The data also suggest that ious species are affected differently by the nts responsible for small-scale variability. In-idual species in any series are generally over-persed. In Series IV total cell counts and colony nts of the three most abundant species were lyzed. Phytoplankton patches ranging in size m 1 to 21 m were tentatively identified. No cor-tion was found between temperature or salinity the small-scale distribution of individual spe-s. Counts taken on the ebb tide showed popula-n densities were substantially higher than those en in the flood tide. Throughout the 3 or 4 week om, Asterionella japonica was consistently more ndant in the upstream portion of the estuary occurred there in markedly longer chains. he indications of patch sizes in the various izontal series can be obtained from Tukey's tiple comparisons test. INTERACTIONS BETWEEN DDT AND RIVER FUNGI. I. EFFECTS OF p,p'-DDT ON THE GROWTH OF AQUATIC HYPHOMYCETES,
Salford Univ. (England). Dept. of Biology.
S. A. Dalton, Madeline Hodkinson, and K. A. Smith.
Applied Microbiology, Vol 20, No 5, p 662-666, 1970. 3 fig, 43 ref.

Descriptors: *DDT, *Fungi, *Rivers, *Growth rate, *Aquatic plants, Nutrients, Permeability, Metabolism, Ecology, Cycling nutrients, Insecticides, Aquatic animals, Microorganisms, Pesticides.
Identifiers: *Hyphomycetes, *Growth enhancement, Heliscus submersus, Tetracladium setigerum, Varicosporium elodeae, Clavariopsis aquatica.

Effects of concentrations of 0.1 and 60 mg/ml DDT on the Hyphomycetes, Heliscus submersus, Tetracladium setigerum, Varicosporium elodeae, and Clavariopsis aquatica, four aquatic fungi, are studied. Concern for the potential long-term hazards of environmental contamination warranted investigation of the interactions between the insecticide and the aquatic microorganisms. DDT concentration below 2 mg/ml did not affect the growth of the fungi, at higher insecticide concentrations their growth rates were enhanced, increasing with increased concentration; the presence of the insecticide did not alter form of growth curves. In natural waters DDT concentrations rarely exceed 2 mg/ml. These fungi may be insensitive to environmental insecticide exposure; H submersus appears a more sensitive organism. The increased mycelial yields enhanced by the DDT might have resulted from DDT being used as a nutrient, DDT affecting the permeability of the fungal cells to other nutrients, or DDT increasing the metabolic rate of the fungi in the capacity of a cofactor. There may be ecological significance in this DDT enhancement of growth rate since these fungi decompose organic debris and cause the recycling of nutrients in the freshwater environment. (Jones-Wisconsin)

STIMULATORY PROPERTIES OF FILTRATE FROM THE GREEN ALGA HORMOTILA BLENNISTA. I. DESCRIPTION,
Providence Coll., R.I. Dept. of Biology; and Connecticut Univ., Storrs. Biological Sciences.
Thomas J. Monahan, and Francis R. Trainor.
Journal of Phycology, Vol 6, No 3, p 263-269, 1970. 3 fig, 4 tab, 37 ref. OWRR Project A-014-CONN (3).

Descriptors: *Algae, *Growth rates, *Productivity, *Plant growth substances, Photosynthesis, Metabolism, Bacteria, Hydrogen ion concentration, Laboratory tests.
Identifiers: *Green algae, *Hormotila blennista, Filtrates, Growth autostimulation, Growth regulation, Extracellular products, Algal excretions.

Autostimulation of growth by filtrates of Hormotila blennista is attributed to secretion of organic metabolites. The maximum stimulation in excess of 100% was exerted by filtrates obtained from 1 to 4 week old actively growing cultures. The filtrates supported bacterial growth and stimulated the growth of Scenedesmus at pH 6.3, but not at pH 7.7. Stimulatory properties of filtrates were terminated by autoclave treatment. A suggestion is made that extracellular secretions of H blennista influence the survival of the alga and the growth of other organisms. (Wilde-Wisconsin)
W71-08687

FOOD OF LOGPERCH (PERCINA CAPRODES), AND BROOK SILVERSIDE (LABIDESTHES SICCULUS), IN A NEW AND OLD OZARK RESERVOIR,
Bureau of Sport Fisheries and Wildlife, Fayetteville, Ark.
James W. Mullan, Richard L. Applegate, and William C. Rainwater.
Transactions of the American Fisheries Society, Vol 97, No 3, p 300-305, 1968. 2 fig, 3 tab, 12 ref.

Descriptors: *Fish, *Food habits, *Reservoirs, Silversides, Perches, Plankton, Aquatic insects, Crustaceans, Arkansas, Missouri.
Identifiers: *Bull Shoals Reservoir (Ark-Mo), *Beaver Reservoir (Ark-Mo), White River (Ozarks), Percina caprodes, Labidesthes sicculus, Euplankton, Tendipeds, Terrestrial spiders.

A comparison was made of food habits of the logperch, Percina caprodes, and the brook silverside, Labidesthes sicculus, inhabiting a 14-yr-old impoundment and a reservoir in the process of filling. The logperch in the new basin preferred aquatic insects to an exclusion of microcrustaceans; the silverside in the same reservoir ingested both foods and terrestrial spiders, but disdained the planktonic Chaoborus. In the older reservoir the logperch sustained on a mixed diet of benthic crustaceans and aquatic insects, whereas the silverside was largely dependent on insects. W71-08688

ECOLOGY OF YEASTS IN POLLUTED WATER,
Illinois Inst. of Tech., Chicago. Dept. of Biology.
Lynn L. Wollett, and L. R. Hedrick.
Antonie van Leeuwenhoek, Vol 36, No 3, p 427-435, 1970. 1 fig, 3 tab, 42 ref.

Descriptors: *Yeasts, *Water pollution, *Distribution patterns, Environmental effects, Water pollution effects, Industrial wastes, Domestic wastes, Oligotrophy, Fermentation, Sampling.
Identifiers: Rhodotorula, Cryptococcus, Candida, Mycelium.

The density and composition of extant yeasts were determined in 3 freshwater habitats exhibiting low pollution level (A), heavy industrial waste pollution (B), and heavy domestic waste pollution (C). The habitat A was dominated by Rhodotorula and Cryptococcus isolates, whereas the station B - by Rhodotorula and Candida; the majority of isolates at location C were Candida with Rhodotorula being second in abundance. All waters had large yeast population, averaging about 3,000 yeasts per 100 ml, but attaining at times density as high as 27,000/100 ml. The high proportion of Candida was correlated with the presence of human wastes. (Wilde-Wisconsin)
W71-08690

CHEMICAL ANALYSES OF SOME VASCULAR AQUATIC PLANTS,
Savannah River Ecology Lab., Aiken, S.C.
Claude E. Boyd.
Archiv fur Hydrobiologie, Vol 67, No 1, p 78-85, 1970. 4 tab, 22 ref.

Descriptors: *Aquatic plants, *Chemical analysis, *Pigments, Chlorophyll, Nutrients, Plant morphology, Phenology, Inorganic compounds, Eutrophication.
Identifiers: Par Pond (SC), Savannah River (SC).

Lush green specimens of some vascular aquatic plants were collected from a relatively homogenous sector of the impoundment (Par Pond, South Carolina) and analyzed for total alkalinity, ammonia, nitrates, phosphorus, sulfur, calcium, magnesium, potassium, sodium, iron, manganese, copper, zinc, chlorophyll-a and b, and carotenoids. The results indicated the range of inter-specific variation in chemical composition of plants, but provided no basis for a prediction of the levels of

chemical constituents in a particular aquatic community. (WildenWisconsin)

COASTAL WATERS POLLUTION AND MOLLUSKS CULTURE, PROPOSAL FOR PRODUCTION, COMMERCE AND PURIFICATION OF MOLLUSKS,
Ufficiale Sanitario e Medico Provinciale di Toranto, Italy.
A. Leccese, and N. Clerico.
Revue Internationale d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Institut National de la Sante et de la Recherche Medicale, Fondation de le Ville de Nice, Nice, Vols 18 and 19, 1970, p 253-260.

Descriptors: *Coasts, *Aquiculture, *Mollusks, Pollutants, *Industrial wastes, *Municipal wastes, Legislation, *Ultraviolet radiation, Water reuse, Water pollution effects.

With the increase in coastal water pollution by urban and industrial wastes it is more and more difficult to find near-shore water appropriate for the culture of mollusks. Proposals for the production, commerce and legislation of mollusk culture are suggested. Several reclamation methods are in use, however, the method found to be most effective is one which makes use of sea water previously treated with ultraviolet rays which were found not to alter the organolectical characteristics of crustaceans, mollusks and plankton. (Ensign-PAI)

THE PRESENT STATUS OF DISEASES CONNECTED WITH MARINE POLLUTION,
Public Health Labs., Exeter (England).
B. Moore.
Revue Internationale d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Institut National de la Sante et de la Recherche Medicale, Foundation de la Ville de Nice, Nice, Vols 18 and 19, 1970, p 193-223. 28 ref.

Descriptors: *Water pollution effects, *Diseases, Environmental sanitation, *Infection, *Public health, Bacteria, Microorganisms, Coasts.
Identifiers: England.

Studies on sewage contamination of coastal waters were conducted by a group of British public health bacterioligists. The most effective methods of control are assessed as to whether control of the environment is necessary, or immunization with appropriate vaccines. A disesase may be proved to be caused by pollution before the organism has been isolated in the laboratory. Also the isolation of a pathogenic agent from the environment does not prove that the environment is a danger to health. Monitoring procedures to determine the diseases present in a specific community and the assessment of whether the environment monitored is dangerous in its own right, are considered. Relevant diseases to consider are those in which transmission is usually by the faecal-oral route, particularly water-borne diseases. Diarrhoeal diseases, poliomyelitis and infectious hepatitis are discussed in detail. Shellfish pollution is briefly mentioned. (Ensign-PAI)

PRESENCE OF POLYNUCLEAR AROMATIC HYDROCARBONS IN COASTAL WATERS AND THE POSSIBLE HEALTH CONSEQUENCES,
World Health Organization, Copenhagen (Denmark). Regional Office for Europe.
Michael J. Suess.
Revu Internationale d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Institut National de la sante et de la Recherche Medicale, Foundation de la Ville de Nice, Nice, Vols 18 and 19, 1970, p 181-190. 46 ref.

Descriptors: Pollutants, *Industrial wastes, *Municipal wastes, Fish, *Food chains, *Public health, Coasts, Estuaries, Water pollution effects, *Aromatic compounds, Plants.
Identifiers: Polynuclear aeromatic hydrocarbons, Endogenic synthesis, Carcinogens.

Carcinogenic polynuclear aromatic hydrocarbons are distributed widely throughout the world, being found in coastal waters near heavily populated areas as well as in remote unpopulated zones. Endogenic synthesis of flora appears to a major contributor, however, PAH concentrations in coastal waters and estuaries may be increased by industrial and municipal effluents and atmospheric precipitation. Though no definite evidence exists that waste effluents polluting our seafood, have become an actual environmental cancer hazard to the general population it is still wise to remain concerned to forestall problems in the future. (Ensign-PAI)

AQUACULTURAL DEVELOPMENT AND PUBLIC HEALTH,
Food and Agriculutre Organization of the United Nations, Rome (Italy). Inland Fishery Resources Branch.
H. R. Rabanal.
Revue Internationale d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Institut National de le Sante et de la Recherche Medicale, Fondation de la Ville de Nice, Nice, Vols 18 and 19, 1970, p 155-167. 40 ref.

Descriptors: *Aquiculture, *Proteins, *Food chains, *Human population, *Public health, Pollutants, Sewage, Fertilizers, Pesticides, Industrial wastes, Radioactive wastes, Water pollution effects.

Large scale development of aquaculture to meet the current and future shortage of high quality animal protein for the increasing world population is discussed. Several institutions and agencies in different parts of the world are actively engaged in investigations to establish aquaculture. In a number of countries, particularly in Asia and the Far East, the culture of sih and shellfish in brackish waters is rapidly expanding. There are certain public health problems associated with acquacultural development. Environmental changes brought about by impoundment of estuarine and coastal areas may result in increased hazards of water-borne diseases. Sewage effluents and animal manures as fertilizers for aquaculture, the uptake and accumulation of pesticide residues, industrial by-products, radioactive wastes and other pollutants and the danger of eating contaminated fish or shellfish grown in polluted water are all dangers to be considered. To deal effectively with the public health aspects of aquaculture close collaboration between medical scientists, aquaculture specialists and international agencies such as FAO and WHO is necessary (Ensign-PAI)

Revue International d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie e d'Oceanographie Medical, Institut National de l Sante et de la Recherche Medicale, Fondation de l Ville de Nice, Nice, Vols 18 and 19, 1970, p 131-143.

Descriptors: *Self-purification, *Bacteria, *Water purification, Water pollution control, Sea water, Water pollution effects.
Identifiers: *Filtering organisms, Ciona, Amphioxus, Salpa, Salmonella.

The filtering mechanism of some 'filter feeders' ciona, amphixus, and Salpa were studied for their purifying action. Test-bacteria used were Salmonella (Ratin strain) labelled with p32 and paratuberculous bacilus (Pasteur No 607). Macroscopic demonstration of this activity was accomplished by dying bacteria with Rhodamin B and was strengthened by normal and fluorescent microscopy after dying with Ziel-Nielsen and Auramin. The determination of radioactivity of filtering organisms, using a geiger counter and bacteria labelled p32, permitted a qualitative or quantitative evaluation of the phenomena of predation. ANTIBIOSIS PHENOMENA OF PHYTOPLANKTONIC ORIGIN IN THE MARINE ENVIRONMENT, ANTIBACTERIAL SUBSTANCE PRODUCED BY A DIATON ASTERIOMELLA JAPONICA, (PHENOMENES D'ANTIBIOSE D'ORIGINE PHYTOPLANCTONIQUE E MILIEU MARIN, SUBSTANCES ANTIBACTERIENNES PRODUITES PAR UNE DIATOMEE ASTERIONELLA JAPONICA),
Centre d'Etudes et de Recherches de Biologie d'Oceanographie Medicale, Nice (France).
M. Aubert, D. Pesando, and M. Gauthier.
Revue Internationale d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie d'Oceanographie Medicale, Institut National de Sante et de la Recherche Medicale, Fondation de Ville de Nice, Nice, Vols 18 and 19, 1970, p 69-7 14 ref.

Descriptors: *Self purification, *Bacteria, *Phytoplankton, *Marine bacteria, *Soil bacteria, Chromatography, Water pollution effects.
Identifiers: Mediterranean phytoplankton, Antibacteria substances.

In situ investigations of several Mediterranean phytoplanktonic species producing antibacterial substances were observed. More than 25% showed antagonistic activity against terrestial bacterial flora. Asterionella japonica synthesized a fatty acid and a nucleoside. These substances were isolated from cell extracts by gel chromatography and studied in detail by physical and chemical processes. Results suggested that these biosecretions play an important role in marine equilibrium. (Ensign-PA

ERMAL POWER, AQUATIC LIFE, AND OWATTS ON THE PACIFIC COAST,
ific Gas and Electric Co., Emeryville, Calif. Enering Research Dept.
es R. Adams.
lear News, Vol 12, No 9, p 75-79, Sept 1969. 5 l tab, 10 ref.

criptors: *Thermal power, *Cooling water, ssolved oxygen, Discharge measurements, er temperature, Aquatic life, California, Water ution effects.

ause of the differing physical processes in- ed, the evaluation of factors effecting aquatic from cooling water discharged from thermal tric power plants should be studied primarily at site rather than in a laboratory. The physical, mical and biological effects of heated water harges were measured at 15 California stations. n 17 papers and 68 mimeographed reports, e representative studies in three catagories n stations in both estuarine and open ocean enments are summarized: (1) thermal tolerance ies, (2) dissolved oxygen measurements and natural temperature changes. Studies on the mal tolerance of fish include assessment of the cts not only of the temperature changes, but of size of the area influenced by the discharge and time which an organism is subjected to particu- temperature elevations. Contrary to some ratory evidence, field evidence reviewed onstrated that the temperature increase does cause a change in the dissolved oxygen content ne water. Daily recordings of natural tempera- flucuations, which often exceed 20 deg F in e bays and at various depths in the open ocean, v that marine animals and plants are exposed to tantial natural fluctuations. IE ASPECTS OF MARINE PHYTOPLANKN STUDIES NEAR THE COLUMBIA RIVER, TH SPECIAL REFERENCE TO A SUBSURE CHLOROPHYLL MAXIMUM,
hington Univ., Seattle. Dept. of Oceanography.
rge C. Anderson.
ilable from the National Technical Information ice as RLO 1725-168, $3.00 in paper copy, 5 in microfiche.

criptors: *Phytoplankton, *Hydrography, trients, *Primary productivity, *Chlorophyll, ers, Water pollution effects, Oregon, Washing- *Columbia River.
tifiers: Species distribution, Size fractionation.

Studies begun in 1961 of the phytoplankton and primary production processes off the Washington and Oregon Coasts and the effects of the Columbia River on these waters are presented. Seasonal and areal distributions of phytoplankton concentrations and primary production rates are given along with relationships of these distributions to the areas hydrography. Also mentioned are size fractionation of phytoplankton populations in different seasons and locations, populations adaptation to light, phytoplankton excretion of dissolved organic matter, and the seasonal and vertical distribution of particulate matter. Mechanisms regulating the supply of nutrients to surface waters and to processes which form chlorophyll concentrations at various depths and the importance of these chlorophyll layers to production processes in the effluent area of the Columbia River outfall are emphasized. (Ensign-PAI)

RELEASE OF DISSOLVED ORGANIC MATTER BY MARINE PHYTOPLANKTON IN COASTAL AND OFFSHORE AREAS OF THE NORTHEAST PACIFIC OCEAN,
Washington Univ , Seattle. Dept. of Oceanography.
G. C. Anderson, and R. P. Zeutschel.
Available from the National Technical Information Service as RLO 1725-167, $3.00 in paper, $0.95 in microfiche.

Descriptors: *Phytoplankton, *Organic matter, *Photosynthesis, *Coasts, *Pacific Ocean, Water pollution effects, Eutrophication, Oligotrophy.
Identifiers: *Particulate organic matter, *Dissolved organic matter, *Liquid Scintillation counting.

The rate of release of dissolved organic matter from phytoplankton photosynthesis in offshore and coastal areas of the northeast pacific ocean was measured. A scintillation solution with high counting efficiency was used which allows sampling to be done easily and accurately at sea. Surface and eutrophic waters showed greatest absolute amounts of dissolved organic matter release, however, relative to total production, release was greatest in oligotrophic waters. Production of particulate organic matter and dissolved organic matter release were closely correlated. (Ensign-PAI)
W71-08742

BENTHIC INFAUNA COMMUNITIES OFF THE COAST OF WASHINGTON AND IN PUGET SOUND: SPECIES COMPOSITION AND STRUCTURE OF THE OFFSHORE COMMUNITIES,
Washington Univ., Seattle. Dept. of Oceanography.
Ulf Lie, and Dale S. Kisker.
Available from the National Technical Information Service as RLO 1725-174, $3.00 in paper copy, $0.95 in microfiche. July 10, 1970. 22 p.

Descriptors: *Benthos, *Coasts, *Animals, Water pollution effects, Washington, Amphipoda.
Identifiers: *Infauna, *Puget Sound, *Species composition, *Community structure, Polychaetes, Lamellibranchs, Echinoderms.

The species composition and the structure of three benthic communities were studied off the coast of Washington during 1967 and 1968. The deepwater community was in depths of 154. 5m and mean mud-percentage was 50.09%. In the intermediate depth sand-bottom community was found at depths of 95.8m with mean mud-percentage 30.86%. The shallow water community was at depths of 36.0m with a mean sand percentage of 96.33%. The most abundant species and the mean standing crop for each of the depths was determined. The variability in community diversity is discussed. Lower diversity was found in the shallow water sand-bottom community than in the deeper communities. (Ensign-PAI)

ECOLOGICAL EFFECTS OF POWER-PLANT COOLING,
Oak Ridge National Lab., Tenn. Ecological Sciences Div.
Charles C. Coutant.
Preprint Ecological Problems in the Marine Environment, 1st National Biological Congress, American Institute of Biological Sciences and Federation of American Societies for Experimental Biology, p 15-26, November 10, 1970, 3 fig, 1 tab.

Descriptors: *Environmental effects, *Ecology, *Powerplants, *Water pollution control, *Thermal pollution, Sites, Design, Monitoring, Control systems, Pollution abatement, Heated water.

Ecological problems associated with thermal pollution from power plants are discussed. These problems include a need for: 1) studies of biological changes caused; 2) multidisciplinary approaches; 3) standardization of site selection and surveying practices; 4) consistent temperature standards and regulations for maintaining water quality; and 5) an education of public attitudes. A review of literature on the biological and ecological effects of temperature changes is given. A discussion of steps in power-plant site selection and discharge design is presented, including a table outlining the pertinent ecological effects to be considered. An effective monitoring program must: 1) show if design changes are needed in the thermal discharge system to protect aquatic life; and 2) contribute toward quantitative models of thermal effects applicable to designing new effluent systems. Mention is made of the over 363 federal, state and utility research programs on thermal pollution problems presently being conducted throughout the country. (McEntyre-PAI)

POSSIBLE EFFECTS OF A SEA-LEVEL CANAL ON THE MARINE ECOLOGY OF THE AMERICAN ISTHMIAN REGION,
Battele Memorial Inst., Columbus, Ohio. Columbus Labs.
W. E. Martin, J. A. Duke, S. G. Bloom, and J. T. McGinnis.
Preprint Ecological Problems in the Marine Environment, 1st National Biological Congress, American Institute of Biological Sciences and Federation of American Societies for Experimental Biology, p 3-14, November 10, 1970. 1 tab.

Descriptors: *Ecology, *Environmental effects, *Canals, *Oceans, *Mixing, Ecosystems, Aquatic habitats, Migration, Open channels.
Identifiers: *American Isthmian Region, *Proposed sea-level canal.

Scientists have questioned the possible long-term ecological consequences of reuniting the Pacific and Caribbean biota via a sea-level canal. This preliminary report of research undertaken by the Bioenvironmental and Radiological-Safety Feasibility Program presents a literature survey summary of the marine ecology and physical oceanography of the isthmian region, and explores the marine habitats and biotic communities on both sides of the Isthmus, the role of mathematical modeling in studies of possible mixing processes, and the predictions of physical, biological, faunistic and floristic consequences. Conclusions from the ecological information available suggest net water flow would be from Pacific to Atlantic, with passive migration of planktonic organisms occuring likewise from Pacific to Atlantic. No evidence was found for predicting serious economic effects on fisheries or for mass migrations with widespread competition and extinction. (McEntyre-PAI)

WATER POLLUTION FROM PHOSPHATE,
Alice Q. Howard.
EnFo, January 1971, 4 p, 1 tab.

Descriptors: *Phosphates, *Detergents, *Water pollution effects, *Water pollution control, *Biodegradation, Fishkill, Eutrophication, Algal blooms, Water quality.
Identifiers: Enzyme presoaks, Dishwater detergents, NTA.

An evaluation of water pollution by phosphates in household detergents is presented. The distinction is made between biodegradability, or the breakdown ability of the cleaning agent of detergents in waste water, and the phosphate problem. Phosphates are placed in detergents to act as water softeners to make the cleaning agent more effective. The cycle of pollution effects from phosphate-induced plant growth include excessive algae blooms, excessive oxygen use as the plants later die, and finally suffocation of animal life such as fishes. The USDI estimates that 50-70% of phosphorus in city sewage comes from detergents. Phosphate substitutes such as NTA require extensive research to be sure they do not cause problems of their own. Enzyme presoaks and automatic dishwater detergents have high phosphate levels. Suggestions for consumer action to reduce phosphate use are given, including a list of detergents and their phosphate per load content. (McEntyre-PAI)

PESTICIDES AND PLOYCHLORINATED BIPHENYLS IN ESTUARIES,
Bureau of Commercial Fisheries, Gulf Breeze, Fla. Center for Estuarine and Menhaden Research.
Thomas W. Duke.
Preprint, Ecological Problems in the Marine Environment, 1st National Biological Congress, American Institute of Biological Sciences and Federation of American Societies for Experimental Biology, p 27-32, November 10, 1970.

Descriptors: *Pesticides, *Pesticide toxicity, *Estuarine environment, *Industrial wastes, *Environmental effects, Pesticide residues, Estuaries, DDT, Chlorinated biphenyls.
Identifiers: *Polychlorinated biphenyls.

A survey is presented on pesticides and polychlorinated biphenyls (PCBs) and their water pollution effects in estuaries. Sources of pesticides are agricultural area run-off, direct application for insect control, and municipal and industrial effluents, while sources of PCBs are industrial effluents. Various monitoring programs have located pesticide residues in fish and shellfish. Examples of effects of pesticides on ecosystems are given, such as regional declines of the speckled seatrout, the altering of capacity of phytoplankton to photosynthesize, mortality and abnormalities in crabs fed brine shrimp nauplii containing DDT, affects on embryonic development and larvae of filter-feeding mollusks, and death of sheepshead minnows. PCBs, including Aroclor 1260 and Aroclor 1254, have been located in bays and estuaries, in seals, porpoises, birds, fish, mussels, and shellfish. Bioassays conducted to determine effects of Aroclor 1254 on estuarine organisms show that the animals can concentrate the PCB, which can be toxic at concentrations in the ppb range. Realizing the potential hazard of PCBs, the Monsanto Chemical Company has recently announced that PCB sales would be limited to only those who could control disposal of the final product. A continual monitoring program of estuaries for toxic materials and effects is a necessity. (McEntyre-PAI)

NUTRIENT MANAGEMENT IN THE POTOMAC ESTUARY,
Federal Water Quality Administration, Annapolis, Md. Chesapeake Support Lab.
Norbert A. Jaworski, Donald W. Lear, Jr., and Orterio Villa, Jr.
Technical Report 45, January 1971, 69 p, 21 fig, 3 tab.

Descriptors: *Estuaries, *Nutrients, Water quality control, *Ecology, *Algae, *Eutrophication, Nutrient requirements, Municipal wastes.
Identifiers: *Potomac River Estuary.

The water quality of the upper Potomac Estuary has been degraded as a result of municipal wastewater from the metropolitan area of Washington. Past studies indicated high coliform densities, low dissolved oxygen content, and large populations of blue-green algae as major water quality management problems of the upper and middle areas of the estuary. Studies and concepts used to formulate a nutrient management program for the Potomac Estuary are presented. Current water quality conditions and ecological trends are discussed. The sources, controllability, transport and criteria establishment of nutrients are discussed and suggestions for wastewater treatment requirements and a water quality management program are made. BIOLOGICAL AND OCEANOGRAPHICAL SURVEY OF THE SANTA BARBARA CHANNEL OIL SPILL 1969-1970, VOLUME I: BIOLOGY AND BACTERIOLOGY; VOL II: PHYSICAL, CHEMICAL AND GEOLOGICAL STUDIES.
University of Southern California, Los Angeles. Allan Hancock Foundation.

Allan Hancock Foundation, University of Southern California, Sea Grant Publication No 2, 1971, Vol 1, 426 p, Vol. 2; 477 p.

Descriptors: Water pollution effects, Water pollution control, *Environmental effects, *Oil wastes, Oily water, Water pollution sources, Aquatic animals, Aquatic habitats, California, Sampling, Pollutant identification.
Identifiers: *Oil spills, *Santa Barbara (Calif).

On February 20, 1969, the Western Oil and Gas Association awarded a research grant to the Allan Hancock Foundation, University of Southern California, to study the biological and oceanographical effects of oil spillage in the Santa Barbara Channel following the 1969 blowout. The grant was for a twelve month field study so that indications of recovery, as well as damage, could be studied. The results summarized data available from government agencies, including the California State Water Quality Control Board, the California Department of Fish and Game, the Federal Water Quality Administration, and the United States Bureau of Commercial Fisheries. Unfortunately no all of the data were available due to restrictions im posed pending several legal suits. The results o these research papers in Volume I were compile by Dr. Dale Straughan and edited by Mrs. D. Hal mos. Papers in Volume II were compiled and edite by Dr. Ronald L. Kolpack. NATURAL OIL SEEPS: HISTORICA BACKGROUND,
University of Southern California, Los Angele Allan Hancock Foundation.
C. Ventura, and J. Wintz.
In: Biological and Oceanographical Survey of th Santa Barbara Channel Oil Spill, 1969-1970, Vo 1, Biology and Bacteriology, p 11-16, 1971, 16 ref

Descriptors: *Oil, *Seepage, History, *Oily wate Water pollution sources, Surface waters, Califo nia, Water pollution effects.
Identifiers: *Santa Barbara Channel.

Natural oil seeps in the Santa Barbara Chann were recorded prior to Spanish settlements in t 1780s. Indians used the material for waterproofi and mending canoes; Cabrillo mentions tarry su stances in Santa Barbara Bay and in 1543 seam passing the area record the smell of bitumen. N merous journals and shiplogs contain similar ports of submarine seeps. Recent photographs these seeps show three types of oil release: 1) sm beads concentrated over crusty white sediments; tar mounds from which teardrops of visco material with whiplike tails escape, and 3) globul released at two to three second intervals. Depe ing on the nature of the seepage, daily relea range from 11 to 160 barrels, with an average being 50 to 70 barrels. Plotted positions of kno offshore seeps include one near Platform A, site the 1969 Santa Barbara Channel oil spill. (See a W71-08776) (Moe-PAI)

PRIMARY PRODUCTIVITY IN THE SAN BARBARA CHANNEL,
University of Southern California, Los Ange Allan Hancock Foundation.
M. Oguri, and R. Kanter.
In: Biological and Oceanographical Survey of Santa Barbara Channel Oil Spill, 1969-1970, 1, Biology and Bacteriology, p 17-48, 1971. 18 2 tab, 9 ref.

Descriptors: *Phytoplankton, *Aquatic produc ty, *Environmental effects, *Oily water, Samp On-site data collections, Cruises, California, W pollution effects.
Identifiers: *Santa Barbara Channel.

Artificial alterations in the environment join n ral environment cycles to effect change phytoplankton production, thus effecting amount of energy available for most sea organi The Santa Barbara Channel oil blowout in Jan 1969 substantially increased the amount of o ready present from natural oil seeps. To deter the effects of increased quantities of oil, samp of normal phytoplankton productivity were m first at 11 stations in the eastern part of the S Barbara Basin, and then during five cruises o entire basin. Results are shown in tables graphs. The possibility of low productivity resu from the presence of surface oil did not appe be substantiated by the data. (See also 08776) (Moe-PAI)

crease in the standing crop of benthic fauna
reported through surveys taken from 1956 to
; studies made after the January 1969 Santa
ara Channel oil spill show that the standing
of macro-invertebrates continues to decrease
atically. Several reasons could cause the
ease: abnormally high rainfall, increase in
ge due to increased human population, well
ng operations, and the oil spill. However, the
of data from 1960 to 1969 makes it impossible
inpoint the exact cause of the population
ction. A large-scale program is needed to
tor the benthos. Increased human activity in
area can only be deleterious, therefore a
nal program of exploitation is recommended.
diminishing Listriolobus beds on the Santa
ara shelf are unique to that area and must be
rved. (See also W71-08776) (Moe-PAI)

NOTES ON SOME OPHIUROIDS FROM THE SHELF OFF SANTA BARBARA,
University of Southern California, Los Angeles.
Allan Hancock Foundation.
Jack Wintz, and Kristian Fauchald.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 149-158, 1971. 1 fig, 3 tab, 6 ref.

Descriptors: *Benthic fauna, *Distribution patterns, *Aquatic habitats, Sampling, Water pollution effects, California, Pollutant identification.
Identifiers: *Santa Barbara channel, *Ophiuroids, *Amphiodia.

Physical and habitat characteristics of Amphiodia digitata and A. urtica are compared, as part of a study of ophiuroids collected in a benthic fauna survey taken after the January 1969 Santa Barbara oil spill. A. urtica is the dominant ophiuriod in the area sampled. Depth distribution findings indicated that the species may be more frequent in deep water rather than in intermediate depths, a contrast to earlier studies of the entire Southern California coast. Habitats for nine ophiuroids collected are briefly described. (See also W71-08776) (Moe-PAI)
W71-08782

A STUDY OF THREE SANDY BEACHES IN THE SANTA BARBARA, CALIFORNIA, AREA,
University of Southern California, Los Angeles.
Allan Hancock Foundation.
Thomas Trask.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 159-177, 1971. 15 tab.

Descriptors: *Invertebrates, *Beaches, *Oily water, *Distribution patterns, *Density, *Crustaceans, Mollusks, Water pollution effects, California, Pollutant identification.
Identifiers: *Santa Barbara Channel.

An investigation of species density of invertebrate infauna on Santa Barbara's sandy beaches was made, to determine seasonal variation of the number and abundance of species. The sampling was begun six months after the Santa Barbara Channel oil blowout. As no similar studies were made at the area prior to the blowout, conclusions cannot be drawn about the effect of the spill. Samples were collected from July 1969 to April 1970, at Carpinteria State Beach, Coal Oil Point Beach and Ellwood Beach. They were taken along predetermined lines at low tide. Tables list the number of specimens collected of species of crustacea, polychaeta and mollusca, as well as of insect larvae and unidentified nemertea. (See also W71-08776) (Moe-PAI)
W71-08783

A STUDY OF THE BACTERIAL POPULATION OF BOTTOM SEDIMENTS IN THE SANTA BARBARA CHANNEL AFTER THE OIL SPILL,
University of Southern California, Los Angeles.
Allan Hancock Foundation.
Sister Damien Marie Juge.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 179-222, 1971. 33 fig, 9 tab, 2 ref, 4 plates.

Descriptors: *Aerobic bacteria, *Bottom sediments, *Oily water, *Drainage water, *Density, Water pollution effects, California.
Identifiers: *Santa Barbara Channel.

Observations made of bacterial populations in waste fields after the Santa Barbara Channel oil slick conflict with prior studies. The Santa Barbara study was intended to observe the effect of increased levels of oil and its degradation products in the benthic and sedimentary bacterial population. Materials and methods of the research are described. Until the oil content of individual sediment samples is determined, conclusions can not be drawn; therefore, this paper is considered to be a preliminary report. Data are presented in tables and graphs, showing counts of aerobic bacteria per gram net weight at specific depths at nine sampling stations. (Moe-PAI)
W71-08784

BREEDING AND LARVAL SETTLEMENT OF CERTAIN INTERTIDAL INVERTEBRATES IN THE SANTA BARBARA CHANNEL FOLLOWING POLLUTION BY OIL,
University of Southern California, Los Angeles.
Allan Hancock Foundation.
Dale Straughan.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 223-244, 1971. 1 fig, 4 tab, 14 ref, 1 plate.

Descriptors: *Oily water, *Intertidal areas, *Invertebrates, *Larvae, *Breeding, Water pollution effects, Mussels, Bloodworms, Crabs, California.
Identifiers: *Santa Barbara Channel, *Goleta Point.

To determine effects of oil on breeding and larval settlement of intertidal animals, studies were made of those exposed to sublethal doses of oil from natural seepage and on those which survived the January 1969 Santa Barbara oil spill. Species, chosen from a variety of habitat, represented barnacles, mussels, limpet, sand crab and bloodworm. Samples were collected from seep and non-seep areas in and near the Santa Barbara Channel from Goleta Point. They were examined for amount of oil on the animal, new settlement, and the number of adults breeding. Effects on reproduction depended upon the species. Findings are reported in the text and in tables. (See also W71-08776) (Moe-PAI)
W71-08785

OIL POLLUTION AND FISHERIES IN THE SANTA BARBARA CHANNEL,
University of Southern California, Los Angeles.
Allan Hancock Foundation.
Dale Straughan.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 245-254. 4 fig, 2 tab, 1 ref.

Descriptors: *Oily waters, *Fish populations, *Fishing, *Fishkill, Water pollution effects, California.
Identifiers: *Santa Barbara Channel.

Despite reports of smaller yields of fish caught by commercial and party boat fishermen after the January 1969 Santa Barbara oil spill, post-spill surveys made by the California Department of Fish and Game indicate few variations from earlier surveys. Fish sampled appeared healthy and well fed; species diversity was reported maintained. Lower yields were attributed to a reduction of fishing boats entering the area, because fishermen either feared that fish would be contaminated or were unwilling to take extra time to clean oil from boats and gear. (See also W71-08776) (Moe-PAI)

WHALES, DOLPHINS AND OIL POLLUTION,
Johns Hopkins Univ., Baltimore, Md. Dept. of Pathobiology.

Robert L. Brownell, Jr.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 255-276, 1971. 3 tab, 20 ref.

Descriptors: Water pollution effects, *Mammals, *Animal behavior, *Migration, *Mortality, *Oily waters, Aquatic animals, California.
Identifiers: *Santa Barbara Channel, *Mass media, *Whales, *Dolphins.

Newspaper and journal reports cited oil contamination as the cause of death of several whales and dolphins stranded after the January 1969 Santa Barbara Channel spill. Brief accounts of these reports are presented, followed by discussion of the individual whale strandings and the probable cause of death. In highly publicized cases when newspapers linked whale death directly to the oil spill, autopsies and tissue analysis revealed no unusual presence of oil. Also the number of gray whale strandings in 1969 did not significantly differ from that of previous years. An account of gray whale feeding and migration habits is included. W71-08787

OIL CONTAMINATION AND ELEPHANT SEAL MORTALITY: A 'NEGATIVE' FINDING,
California Univ., Santa Cruz. Crown Coll.
Burney J. Le Boeuf.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 277-285, 1971. 3 fig, 2 tab, 2 ref.

Descriptors: Water pollution effects, *Oily water, *Aquatic animals, *Migration, Tagging, *Mortality, California.
Identifiers: *Santa Barbara Channel, *San Miguel Island, *Seals, Elephant seals.

The crude oil that coated 100 weaned elephant seal pups a month after the Santa Barbara Channel spill apparently had no deleterious effect on the pups' health. Through the National Park Service, the animals were examined and specimens analyzed. No oil was found in tissue of two dead seals or in blood samples from the few sick ones. Because of the incompleteness of the Park Service report, more information was sought through a tagging survey, to see if the pups would be effected after they went to sea. In 15 months following tagging, 40% of the oil groups pups were sighted, compared to 25% in the control group. Except for one oil group animal, all animals were reported in apparent good health. Only one showed traces of oil. The data supported earlier conclusions while adding information on absence of long-term deleterious effects. (See also W71-08776) (Moe-PAI)
W71-08788

CALIFORNIA SEA LION MORTALITY: NATURAL OR ARTIFACT,
Johns Hopkins Univ., Baltimore, Md. Dept. of Pathobiology and; California Univ., Santa Cruz. Crown Coll.
Robert L. Brownell, Jr., and Burney J. Le Boeuf.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 287-306, 1971. 2 fig, 1 tab, 37 ref.

Descriptors: Water pollution effects, *Oily water, *Aquatic animals, *Pesticides, *Mortality, Reproduction, Mammals, California.
Identifiers: *Santa Barbara Channel, *San Miguel Island, California sea lion.

The small amount of information on mortality, abortion and premature birth rates of the California sea lion is reviewed. Included are data on the possible association of pesticides and oil pollution on sickness and mortality in pinnipeds. Although mass media reported that the several sea lion deaths on San Miguel Island were caused by oil from the January 1969 Santa Barbara Channel spill, investigators found the death rate to be within normal limits, and believe that oil contamination had only a small, if any, deleterious effect on the pups. Also given is a report on the effects of organochlorine pesticides, as DDT and DDE; effects vary greatly among different species of pinnipeds. Frequency data is needed for evaluating future calamites. (See also W71-08776) (Moe-PAI)
W71-08789

OIL POLLUTION AND SEA BIRDS,
University of Southern California, Los Angeles. Allan Hancock Foundation.
Dale Straughan.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 307-312, 1971. 2 tab, 3 ref.

Descriptors: *Oily water, Water pollution effects, *Mortality, *Birds, *Water birds, California.
Identifiers: *Santa Barbara Channel.

An estimated loss of 3,600 birds in a two-month period can be attributed to the January 1969 Santa Barbara Channel oil spill. Loons and grebes had the highest death rates, with cormorants and pelicans second. The count was made on 75.5 miles of beach, from Point Conception to Ventura. Swimming species had the highest mortality rate. Oil causes fine elements of plumage to adhere together breaking down the capacity of feathers to insulate birds from cold water. Specific species mortality figures are given. (See also W71-08776) (Moe-PAI)
W71-08790

SANTA BARBARA'S OILED BIRDS,
California Univ., Santa Barbara.
Barbara Drinkwater, Maurine Leonard, and Susan Black.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 313-324, 1971. 2 fig.

Descriptors: *Water birds, Water pollution effects, *Oily water, *Rehabilitation, *Cleaning, Treatment, California.
Identifiers: *Santa Barbara Channel, Oil-drenched Birds Treatment Center.

Successes and failures in treating oil-drenched birds at a treatment and rehabilitation center which opened after the January 1969 Santa Barbara Channel spill are described. Volunteer workers, none of them ornithologists, began the long procedure by washing birds in warm water with a non-toxic dispersant. They developed several methods for internal treatment, sometimes successful, sometimes not. Problems were many, feeding, food size, diet, floor covering, warmth. Some were solved in inventive ways, as putting tobacco bag booties on feet and legs treated with a moisturizing ointment. Recommendations are given on volunteer training, handling methods and facilities. Because it is necessary to act quickly to save oil-drenched birds, methods of handling should be investigated and available. (See also W71-08776) (Moe-PAI)

THE SANTA BARBARA OIL SPILLS OF 1969: A POST-SPILL SURVEY OF THE ROCKY INTERTIDAL,
University of Southern California, Los Angeles. Allan Hancock Foundation.
Nancy L. Nicholson, and Robert L. Cimberg.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 325-399, 1971. 18 tab, 25 ref, 9 plates.

Descriptors: *Marine plants, *Oily water, Water pollution effects, *Intertidal areas, *Invertebrates, *Algae, California.
Identifiers: *Santa Barbara Channel.

Differences between the January 1969 Santa Barbara oil spill and earlier spills, as the 1957 Tampico Maru accident and the 1969 Torrey Canyon accident are compared. In the two ship incidents, massive kills of intertidal organisms were due to toxic components in diesel oil or dispersants. Spectular effects were not found at the Santa Barbara intertidal, even after a year study. Comparisons are made of marine plant populations from monthly samplings taken at ten rocky intertidal stations in and outside of the spill area. Selection of sampling sites, sampling methods used, and treatment of the data accompany detailed discussion of study findings. Many species are listed in extensive tables that chart the study findings. (See also W71-08776) (Moe-PAI)
W71-08792

WHAT HAS BEEN THE EFFECT OF THE SPILL ON THE ECOLOGY IN THE SANTA BARBARA CHANNEL,
University of Southern California, Los Angeles. Allan Hancock Foundation.
Dale Straughan.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 1, Biology and Bacteriology, p 401-426, 1971. 1 fig, 1 tab, 11 ref.

Descriptors: *Oil, Seepage, Water pollution effects, Environmental effects, *Benthic fauna, *Invertebrates, *Fish populations, *Mortality, *Algae, California.
Identifiers: *Santa Barbara Channel.

Because many questions lack answers, the effect of ecology of the 1969 Santa Barbara Channel oil sp may never be known. Environmental factors su as prior natural seepage, heavy rains, increase sedimentation and a possible increase in pesticide contribute to the problems of isolating oil spill effects. Evidence suggests increased productivity benthic fauna in inshore waters after the spill, d possibly to increased nutrients. Studies of san beach fauna showed no direct effects. Invertebrat whose shells were covered with oil appear healthy. Fish surveys indicate a stable fish popul tion and there is no proof that oil was direc responsible for marine mammal deaths. High m tality rates were recorded in pelagic bird popu tions, marine grass, barnacle species and in mar algae. Hypotheses are presented as to why the sp caused so little damage to the area's ecology, esp cially when compared to other spills. (See a W71-08776) (Moe-PAI)

oxidized red-brown river sediment carried into
Santa Barbara Channel during heavy rains and
rd run-off was easy to trace, as the sediment
rasted with the olive-gray sediment of the
nel. The Santa Clara and Ventura Rivers con-
ted more than 50 x 106 tons of suspended sediment. Initial deposition of about 40 x 106 tons occurred within 20 kilometers of the river mouths. Eighteen months later, more than 15 x 106 tons had accumulated at depths between 500 and 600m in the central portion of the basin. Information on the distribution of suspended particles within the water column was obtained with a continuously-recording beam transmissometer. Mineral composition of the sediment is shown in tables. W71-08798

HYDROCARBON CONTENT OF SANTA BARBARA CHANNEL SEDIMENTS,
University of Southern California, Los Angeles. Dept. of Geological Sciences; and Cincinnati Univ., Ohio. Dept. of Chemistry; and Gulf General Atomic Co., San Diego, Calif.
Ronald L. Kolpack, James S. Mattson, Harry B. Mark, Jr., and Ta-Ching Yu.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 2, Physical, Chemical and Geological Studies, p 276-295, 1971. 9 fig, 5 ref.

Descriptors: *Sediment distribution, *Analytical techniques, *Spectrometers, *Bottom sediments, *Oily water, *Deposition, Water pollution effects, Sediment-water interface, California.
Identifiers: *Santa Barbara Channel, *Hydrocarbons.

Because tar and oil had been observed in shelf and basin sediments collected from the Santa Barbara Channel, the area was selected for a study of hydrocarbon content of surficial marine sediments. The study, begun in late 1968, was intended to evaluate infrared analytical techniques and establish background levels of the hydrocarbon content. Analysis showed higher total hydrocarbon concentrations in areas of maximum oil slick coverage after the January 1969 spill. Subsequently, these hydrocarbons were deposited or redeposited at the sediment-water interface in another part of the channel, and eventually became aligned with the main avenues of sediment transport toward the central basin. Because of the results discussed and supplementary information, researchers believe that estimates of the amount of oil released by the oil blowout are too low. (See also W71-08776) (Moe-PAI)
W71-08799

GENERAL CHARACTERISTICS OF NEARSHORE SEDIMENTS FROM EL CAPITAN TO VENTURA, CALIFORNIA, 1969-1970.
University of Southern California, Los Angeles. Dept. of Geological Sciences.
D. S. Gorsline, B. M. Brenninkmeyer, W. C. Meyer, M. R. Ploessel, and G. I. Shiller.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 2, Physical, Chemical and Geological Studies, p 296-317, 1971. 6 fig, 11 ref.

Descriptors: *Bottom sediments, *Clays, *Particle size, *Sediment distribution, Oily water, *Sediment transport, Organic matter, Carbonates, California, Water pollution effects.
Identifiers: *Santa Barbara Channel.

The texture, coarse fraction components, carbonate content and organic carbon content of nearshore bottom sediments were studied from samples taken from Santa Barbara's mainland coast after the January 1969 oil spill. Descriptions and charts review findings, discussing sediment textures, clay, silt and sand distribution, organic content and carbonate content. General sediment trends support the tentative conclusions that the find load is from the Ventural and Santa Clara rivers and that the sand fraction is probably locally derived. Organic contents definitely show the influence of the oil seeps in the Coal Oil Point area; the sand fraction in all samples contained tar bits and plant debris. (See also W71-08776) (Moe-PAI)

FORAMINIFERAL POPULATIONS IN THE SANTA BARBARA REGION: NEARSHORE SPECIES,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
Ronald W. Morin.
In: Biological and Oceanographical Survey of the Santa Barbara Channel Oil Spill, 1969-1970, Vol 2, Physical, Chemical and Geological Studies, p 318-340, 1971. 12 fig, 10 ref.

Descriptors: Water pollution effects, *Oily water, Aquatic populations, *Benthos, *Benthic fauna, *Plankton, Sewage effluents, California.
Identifiers: *Santa Barbara Channel, *Foraminifera.

After the January 1969 Santa Barbara Channel oil spill, the size of benthonic foraminiferal populations in the channel were compared to populations in order Southern California areas. The channel populations was found to be either normal or relatively large. High level dead ratios within the are of relatively large populations suggest that higher rates of productivity caused the large populations. Distribution patterns of Buliminella elegantissima and of four members of the Nonionidae were generally typical of normal portions of the Calfornia mainland shelf. Thus, effluent from Santa Barbara sewer outfall probably was not responsible for increased productivity; growth is attributed to either the presence of oil or some other environmental factor. HYDROLOGIC EFFECTS OF STRIP MINING WEST OF APPALACHIA,
Geological Survey, Arlington, Va.
D. J. Cederstrom.
Mining Congress Journal, Vol 57, No 3, p 46-50, Mar 1971. 5 p, 3 photo, 5 ref.

Descriptors: *Strip mines, *Strip mine lakes, *Hydrogeology, *Indiana, *Illinois, Acid mine water, Recreation, Strip mine wastes, Spoil banks, Reservoirs, Recharge, Water levels, Flood control, Water resources development, Base flow, Water sources.
Identifiers: Strip mine hydrology.

In the Midwest the problem of acidic water is seemingly much less acute than in Appalachia. In part, this may be due to the fact that the topography is gentle and pyritic material is generally less exposed to oxygenated waters. In Midwest fields, thousands of small lakes have been created in the resultant ridge and furrow topography. These lakes constitute a reservoir of significant magnitude. Further, upon pumping from lakes, saturated bank material, made up of moderately permeable shale fragments or highly permeable sandstone and limestone fragments, will contribute water to the lakes. In this sense, then, the lakes may be thought of as a series of dug wells in which considerable storage is present in each. The ponds and lakes created by disturbed ground are commonly hydrologic benefits in the sense of improvement of the functioning of the hydrologic cycle and also in a secondary sense in that the ponds and lakes are, or can be, distinct recreational assets. (Knapp-USGS)

5D. Waste Treatment Processes

REACTIONS OF A STRONGLY BASIC ION EXCHANGE RESIN WITH DILUTE AQUEOUS SOLUTIONS IN A COLUMNAR SYSTEM,
Michigan Univ., Ann Arbor. Div. of Sanitary and Water Resources Engineering.
William S. Midkiff, and Walter J. Weber, Jr.
Available from the National Technical Information Service as PB-199 643, $3.00 in paper copy, $0.95 in microfiche. Department of Civil Engineering Technical Publication T-69-4, Nov 1969. 136 p, 53 fig, 48 ref, 3 append.

Descriptors: *Ion exchange, Water reuse, Waste water treatment, *Aqueous solutions, Water chemistry, *Separation techniques, Anion exchange, *Resins, Chemical reactions, Kinetics, Chromotography, *Chemical analysis, Ions, Analytical techniques, Mathematical models, Sulfates, Phosphates, Nitrates.
Identifiers: *Reaction zones, Separation zones.

The objective was an engineering evaluation of the use of ion exchange for removal of selected anions from waste water. The research extended to the technology of water conservation with respect to upgrading the quality of municipal waste water treatment plant secondary effluents and storm runoffs for reuse. High molecular weight is not a significant factor in fouling or operational interference of a strong basic anion exchange resin. An organic species must be a counterion before it will penetrate the strong-base resin pore structure to cause foulding. No significant difference in performance was indicated when the one inch column was compared to a column with nine times the surface area. A reaction zone in the column defines the limit of bed depth. As bed depth is increased, chromatographic separation of the ions becomes more prominent. The separate zones become more concentrated and reverse exchange as well as concentration of the less selective ions is enhanced. The reaction zone of the most selective ion is increased with bed depth as an increased competitive ion effect is created with the increased concentration of the less selective ions. A mathematical model has been applied, a modification of one developed by Gleuckauf, combining the effects of equilibrium and kinetics. Analysis of the solute data shows that the more selective the ion, the sharper is the front and the shorter is the reaction zone. The lengths of the reaction zones are in the inverse order from the selectivities. Sulfate has the sharpest front and is followed by phosphate and nitrate.

PIPELINE FLOW OF SOLIDS-LIQUID SUSPENSIONS,
Syracuse Univ., N. Y.
Raffi Turian, Tran-Fu Yuan, and Giacomo Mauri.
Available from the National Technical Information Service as PB-199 708, $3.00 in paper copy, $0.95 in microfiche. July 1970, 122 p, 13 fig, 9 tab, 40 ref. FWPCA Grant No 17070 DUQ.

Descriptors: *Slurry, *Hydrodynamics, Fluid friction, Pipes, Flow rates, Reynold's number, Headloss, Hydraulics, Suspended load, Particle size, Manometers, Flow meters, Mixing, Pressure, Analytical techniques, Laboratory tests, Statistical analysis, Sludge.
Identifiers: Drag co-efficient, Glass.

Suspensions containing closely sized beads of varying diameters, made from two types of glass, were allowed to flow through 2,1 and 1/2 inch pipelines. Available slurry flow data in 1/2 inch pipe using glass, steel, and lead particles were combined with these data, resulting in a particle size range of from 31 micron up to 4380 micron. There were 12 particle sizes, and particle densities of 2.3, 3.0, 4.4, 7.5 and 11.3 gm/cc, with the entire data set consisting of 1511 points. From these data points, a slurry flow correlation was developed which predicts the slurry friction factor within an absolute average deviation of 9.5% for the entire data collection, with 74 data points having a deviation exceeding 30% and 9 data points with a deviation greater than 50%. Utilization of the correlation involved recasting of the drag coefficient--Reynold's Number relationship into an empirical expression valid for numbers well within the Stokes flow region, and up to nearly the so-called drag crisis. While most of the data presented was taken in the laboratory, published data from two sources (selected after stringent scrutiny) were used to supplement certain ranges of the Reynold's number. FIRST NATIONAL SYMPOSIUM ON FOOD PROCESSING WASTES PROCEEDINGS.

Copy available from GPO, Sup Doc as SOD No 167.13/4: 12060--04/70, $3.00; microfiche from NTIS as PB-199 709, $0.95. Conference held Apr 6-8, 1970, at Portland, Oregon, Water Pollution Control Series, 12060--04/70 (1970), 400 p. FWQA Program 12060.

Descriptors: *Waste water treatment, Water reuse, *Industrial wastes, Activated sludge, Sludge treatment, Canneries, Aerobic treatment, Oxidation lagoons, Biological treatment, Water pollution control, *Farm wastes, Filtration.
Identifiers: *Food processing wastes.

This was the first of a planned series of conferences to discuss current research on treatment of food processing wastes. This Symposium was co-sponsored by Pacific Northwest Water Laboratory of the Federal Water Quality Administration, the Western Regional Research Laboratory of the U. S. Department of Agriculture, National Canners Association, and Northwest Food Processors Association. The first two days of the conference were devoted to an in-depth review of current research and demonstration projects which have been funded largely by the Federal Water Quality Administration. The third day was concerned with discussions of research on improved in-plant and in-field processing intended to reduce the quantities of waste needing treatment, and replaced the Annual Western Regional Research Laboratory's Collaborators Conference. FEDERAL WATER QUALITY ADMINISTRATION RESEARCH, DEVELOPMENT AND DEMONSTRATION PROGRAM,
Federal Water Quality Administration, Washington, D. C. Applied Science and Technology, Div.
William J. Lacy, and Harold G. Keeler.
Proceedings, First National Symposium on Food Processing Wastes, April 6, 7, 8, 1970, Portland Oregon, Water Pollution Control Research Series No 12060--04/70, p 5-16.

Descriptors: *Waste water treatment, *Wate reuse, Laboratories, *Research and development Technology, Water supply, Eutrophication, Sludg disposal, Nutrients, Microorganisms, Industri wastes, Municipal wastes.
Identifiers: *Demonstration, Renovation.

The efforts on the part of the FWQA to assist mu nicipalities and industries in the prevention o further pollution, and the renovation of waters a ready polluted consist of three major steps. Thes steps are research, development, and demonstr tion and each step plays a vital role in bringi about acceptance of technological improvement The most critical area at present is the industri wastes research. Industrial wastewater volume 2.5 times that of the sewered population, the BOD load is 3 times, and the suspended solids load over two times that of the sewered population, a within the past few years industry's growth rate h been 3 times the growth rate of the sewered pop lation. The expenditures for research laboratori have been and will continue to be the best availab form of investment in the future, for without i creased technology, man would be buried in own waste products. Also, the safeguarding of o fast dwindling water supplies has become impe tive to man's survival. In the future, greater emph sis will come to be placed on non-pollution disposal of sludge and concentrates. Other areas increasing emphasis include dissolved nutri removal, waste water renovation, and re-use, a microorganism removal, particularly viruses. T answers to these problems may well determine question of the survival of man. (See also W 08398) (Lowry-Texas)

erse osmosis, Activated sludge, Oxidation
ons, Organic loading, Nutrients, Hydrogen ion
centration, Biochemical oxygen demand, By-
ducts, Pilot plants, Ion exchange, Idaho, Waste
er treatment.
tifiers: *Potato wastes, Caustic peeling,
erobic filter.

potato processing industry has experienced un-
lleled growth in the last 2 decades. Along with
large increase in the industry, there has been a
espondingly staggering increase in the amount
aste products produced. At the present time,
age values for the processing of one ton of
toes are 4,200 gallons of water used, with a
esponding effluent of 60 lbs of suspended
ls and 50 lbs of BOD. In 1966, total annual
luction of potatoes was estimated at 15 million
, of which over 35% or 5.25 million tons were
essed. Increased production in the potato in-
ry has caused increased interest in methods of
iating the subsequent pollution. At present,
to processors are faced with having to install
ndary treatment facilities at all of their installa-
s. One method of decreasing the cost of secon-
treatment is reduction of the waste stream it-
Dry peeling of potatoes has been tested on a
l scale, but remains to be proven feasible. If
ble, dry peeling could reduce waste volume
BOD by as much as 50% or more. Also, much
arch work is being done to find new uses for
o solids, such as cattle feed supplements, cul-
media, etc. Technology of the potato waste
ment is such that the pollution control objec-
can be achieved, but much more work
ains to be done before such treatment becomes
ble. (See also W71-08398) (Lowry-Texas)

R. T. French Company of Shelley, Idaho, has
awarded a government demonstration grant
) investigate the feasibility of aerobic secon-

dary treatment of potato wastes; (2) determine BOD removal efficiencies for the system when operated as complete mix activated sludge, a flow-through aeration system without sludge return, and an intermittent aeration system with periods of aeration, clarification, and supernatant draw off. Also included in the tests were: (1) determination of quantity and character of sludge produced; (2) definition of influence of foaming, ice, temperature, pH, nitrogen, and phosphorus on treatment; and (3) cost evaluations. Plant influent averaged 1730 mg/l alkalinity as CaCO3,1680 mg/l BOD, 3050 mg/l COD, 1430 mg/l TSS, temperature of 20C, and pH of 9.3. On the basis of limited testing, inorganic nutrients were present in sufficient amounts. BOD removals of over 90% were obtained for sustained periods, demonstrating the amenability of potato wastes to aerobic biological treatment. pH values were buffered to prevent system upset. Low temperatures were not sufficient by themselves to cause system upset, although significant temperature losses occurred. A detailed analysis of mechanical problems and corrective modifications is presented. The main emphasis has been centered on the need for specialized equipment design for potato wastes. USE OF FUNGI IMPERFECTI IN WASTE CONTROL,
North Star Research and Development Inst., Minneapolis, Minn.
Brooks D. Church, and Harold A. Nash.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 71-89. 6 fig, 7 tab.

Descriptors: *Fungi, *Waste water treatment, *Industrial wastes, Microorganisms, Organic loading, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Temperature, Nutrients, Oxygenation, Digestion, Cost analysis, Proteins, Filtration.
Identifiers: Fungi Imperfecti, *Corn wastes, *Soy wastes.

48 SPECIES OF 18 GENERA OF Fungi Imperfecti were studied for conformance to the following qualities: (1) ability for rapid conversion of corn or soy wastes (suspended or soluble) to mycelial protein; (2) ease of removal from digested waste stream by coarse filtration. These various types of fungi were tested in order to find a strain which would economically treat the corn and soy wastes, and at the same time have some economic value. Trichoderma viride, Gliocladium deliquescens, and either Aspergillus oryzae or Gliocladium deliquescens gave best results on corn, soy and SO2-containing soy wheys respectively. Optimal growth conditions included pH of 3.2 to 3.5 and temperatures of 30C. Low oxygen levels of 1 lb O2/6 to 7 lb COD removed were required, and nitrogen and phosphates were required for the corn wastes. Such pH adjustments as were required were accomplished through addition of sulfuric acid. Laboratory scale testing revealed corn waste reductions from 1600 mg/l BOD to 25 mg/l BOD in the effluent after 24 hours, while soy wastes were reduced from 6200 mg/l BOD to 125 mg/l BOD in 36 hours. Mycelial yields averaged 50 to 60 grams of dry mycelial per 100 gm of COD stabilized. Economic analysis was inconclusive, but laboratory scale data indicated a small profit on soy wastes and sale of fungi as animal supplement would defray 85% of the treatment costs of corn wastes. From these initial observations definite evidence is presented that may evolve into commercial scale use of Fungi Imperfecti to remove BOD in a full-scale plant. (See also W71-08398) (Lowry-Texas)

COMBINED TREATMENT OF DOMESTIC AND INDUSTRIAL WASTES BY ACTIVATED SLUDGE,
Cornell, Howland Hayes, and Merryfield, Corvallis, Oreg.
John L. Graham, and John W. Filbert.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 91-117. 19 fig, 1 tab.

Descriptors: *Aerobic treatment, On-site investigations, Evaluation, Cost analysis, *Municipal wastes, *Industrial wastes, *Activated sludge, Chlorination, Design criteria, Organic loading, Alkalinity, Nitrates, Phosphates, Coliforms, Sludge, Flexibility, Odors, Oregon, *Waste water treatment.
Identifiers: *Aerobic digestion, *Shock loading, Clarification, Dallas (Ore).

Conventional approaches to treatment plant design have been found inadequate to provide the necessary degree of treatment, the operational flexibility, and the system stability required. The need for a new system led to the investigation of a completely aerobic scheme of treatment. Such a plant was constructed to handle widely variable combined municipal and industrial wastes, mainly cannery wastes. Average flow through the plant was 2 MGD, with a BOD5 loading of 7,080 lb/day during the canning season, and 2,080 lb/day during the off-season. Various MLSS levels were experimented with ranging from 700 mg/l to 3000 mg/l in the aeration tank. Alkalinity in the influent flow was found to be sufficient to buffer the system. 95% of the time, effluent BOD5 was 7 mg/l or less. Total construction cost of the plant, consisting of aeration basins, final clarifier, aerobic digestion, chlorination, and sludge lagoons was $506,300, as compared to $950,000 for a conventional plant, or a savings of 47%. Operation and maintenance costs were found to be $20/1,000,000 gal. treated, or a 70% savings over conventional treatment. The following additional conclusions were drawn from the initial data: (1) enough process flexibility is provided to handle shock organic loads and abrupt loading changes; (2) no special operating problems were caused in this instance by elimination of primary clarification and grit removal; (3) despite large flow and organic loading fluctuations, effluent quality remained consistently good; (4) aerobic digestion provided adequate stabilization for this combination of sludges at a substantial reduction in cost over conventional treatment. AEROBIC TREATMENT OF LIQUID FRUIT PROCESSING WASTE,
Gray and Osborne, Yakima, Wash.
Larry A. Esvelt.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series, No 12060--04/70, p 119-143. 9 fig, 4 tab, 12 ref. FWQA Research and Development Project 12060 FAD.

Descriptors: *Aerobic treatment, *Industrial wastes, Cost analysis, Evaluation, *Canneries, Organic loading, Activated sludge, Sludge, Nutrients, Temperature, Flotation, *Waste water treatment, *Oxidation lagoons.
Identifiers: *Contact stabilization, Polyvinylchloride, Clarification, Process control, Surface aerators.

Snokist canneries has the capability to process 250 tons/day of pears or peaches, and 100 tons/day of apples. Peak processing wastes flows of 2.0 mgd with BOD outputs (after screening) of 20,000 lbs/day are experienced during peach and pear processing. Three different combinations of two basins, aerated lagooning, activated sludge, and activated sludge with sludge reaeration, were studied to determine their applicability to this type of wastes. Equations for biological growth, aeration requirements, and sludge production were derived from reactor kinetics and applied to this problem. All tests performed to evaluate performance conformed to 'standard methods.' From the results of data taken over two processing seasons, the following conclusions were drawn: (1) both activated sludge and contact stabilization, when loaded at

F/m—.4 on a COD basis, will provide greater than 90% removal of organic load and SS, with activated sludge requiring fewer facilities at lesser cost, (2) aerated lagooning provided 70% removal of BOD, but allowed considerable suspended solids loss which contributed most BOD and COD loss. However, cost for such a system was considerably smaller than for either of the other two systems. Actual costs are $.041/No.BOD for aerated lagoons, $.061/No.BOD for activated sludge and $.067/No.BOD for contact stabilization. Surface aeration, and PVC lining were both found to be suitable for use in all three types of systems. (See also W71-08398) (Lowry-Texas)

CANNERY WASTE TREATMENT BY TWO-STAGE AERATION PROCESSES,
Oklahoma Univ., Norman. Dept. of Civil Engineering and Environmental Sciences.
Leale E. Streebin, George W. Reid, and Alan Hu.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 145-175. 14 fig, 5 tab, 1 ref. FWQA Demonstration Grant No 12060 DSB.

Descriptors: *Industrial wastes, *Canneries, Sampling, Design criteria, Aerobic treatment, Organic loading, Flexibility, Odor, Chemical oxygen demand, Biochemical oxygen demand, *Waste water treatment, *Aeration.
Identifiers: Extended acration, Shock loads, Clarification, Volatile suspended solids (VSS).

The Stilwell Canning Company of Stilwell, Oaklahoma processes Irish potatoes, sweet potatoes, blackberries, strawberries, squash, peas, beans, okra, green beans, and other green vegetables. Discharge from the plant previously overloaded the municipal treatment facility by as much as 200%. Data showed that peak output of the plant was 1.5 mgd at a strength of 2250 mg/l of COD. A two-stage aeration process was designed and constructed to treat this waste. A sampling program was developed with sampling points at the Parshall flume, the minimal solids aeration unit, the extended solids acration unit, and after the final clarifier. From the investigation, the two stage aeration system was shown to be capable of accepting shock loads with no adverse affects, partially due to the extreme system flexibility. Recycling of the mixed liquor from the extended aeration system allows minimal solids to be restarted readily. Loading rates varied from an F/m of 1/1 to an F/m of 20/1, while removal ranged from 66 to 99% of the soluble COD. Also, receiving stream D.O. was maintained above 4.0 mg/l over the entire length of the stream for the whole canning season. (See also W71-08398) (Lowry-Texas)

LIME TREATMENT AND IN-PLANT RE-USE OF AN ACTIVATED SLUDGE PLANT EFFLUENT IN THE CITRUS PROCESSING INDUSTRY,
Environmental Engineering, Inc., Gainesville, Fla.
Richard H. Jones.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 177-188.

Descriptors: *Citrus fruits, *Industrial wastes, *Activated sludge, Oranges, Grapefruit, Sludge, Organic loading, Biochemical oxygen demand, Chemical oxygen demand, Dissolved oxygen, Nutrients, Lime, Sedimentation, Centrifugation, Aeration, *Water reuse, *Waste water treatment.
Identifiers: Hydraulic loading, Suspended solids, *Lime treatment.

Winter Garden Citrus Products Co-operative was given 6 weeks in which to find an acceptable treatment method for their wastewater or shut down their operation. On the basis of a 4 week laboratory scale study and no pilot scale study, an activated sludge plant incorporating lime treatment of the effluent to provide subsequent re-use as barometric leg water and cooling water, was designed and built. Orange and grape fruit wastes per box (90 lbs of fruit) were 25 gallons of concentrated waste water containing 1/4 lb of BOD. The new plant was designed to treat 2 mgd averaging 2000 mg/l of BOD. Waste water loads varied with the availability of fruit, with flow ranging from 1.5 mgd to 0.00 mgd, and from .04 lbs BOD/lb MLSS to .378 lbs BOD/lb MLSS, with a seasons average of .143 lbs BOD/lb MLSS. It was determined that the plant was loaded to approximately 60% of capacity both hydraulically and organically. The following conclusions were obtained after one season of operation: (1) 99% organic removal efficiency is possible using the complete mixed activated sludge process to treat citrus wastes; (2) effluent from the treatment system can be re-used in the plant, and waste sludge and peel can be used as cattle feed; (3) slug additions of orange oil and peel press liquor disrupt treatment efficiency and cause heavy foaming; (4) extensive daily testing must be utilized to determine nutrient requirements due to the highly variable load; and (5) high excess solids production must be considered as a key factor. CANNERY WASTE TREATMENT BY A HIGH SOLIDS ACTIVATED SLUDGE PROCESS,
FMC Corp., Santa Clara, Calif.
Warren G. Palmer.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series, No 12060--04/70, p 227-259. 15 fig, 4 tab, 3 ref. FWPCA Research and Development Grant No 12060 EZP.

Descriptors: *Activated sludge, *Pre-treatment (Water), Industrial wastes, *Canneries, Sludge, Oxidation, Organic loading, Aeration, Digestion, Biochemical oxygen demand, Hydrogen ion concentration, Phosphorus, Nitrogen, *Waste water treatment.
Identifiers: Kehr activated sludge process, *Shock loading, Mixed liquor suspended solids (MLSS), Total organic carbon.

The Kehr modification of the activated sludge process was studied in comparison to the conventional activated sludge process to determine its applicability for industrial waste treatment. The Kehr Activated Sludge Process (KASP) consists of an activated sludge process with a MLSS concentration of 10,000 to 14,000 mg/l, an aeration time of 6 hours and no controlled sludge wasting. Laboratory scale testing runs using a 120 gal aeration tank, were conducted. It was determined that KASP has the following advantages (1) because of the high solids concentration, a smaller volume of aeration tank is required to effect the same BOD removal, (2) the high solids concentration provides increased buffering alkalinity, and (3) KASP was able to go for extended periods with no loading, or undergo periods of slug or 'shock' loading with little adverse effect. On the other hand, KASP does not remove either nitrates or phosphates, and the percent reduction of TOC is also less than can be achieved by conventional plants. From the preceding analyses, the Kehr-Activated Sludge Process appears to have considerable application in industrial situations where widely varying hydraulic and organic loads are encountered, possibly as a pretreatment process. Pilot scale investigations are recommended prior to design to determine design parameters for each individual waste. (See also W71-08398) (Lowry-Texas)

oxygen, Hydrogen ion concentration, Biochemic
oxygen demand, Chemical oxygen demand, Odo
*Water reuse.
Identifiers: *Facultative lagoon, Flume water.

Sugar beets provide 30% of the sugar used in t
United States. An average of 2200 gallons of wa
is required per ton of sugar beets for fluming a
washing operations. Effluent wastes are discharg
from four major sources as: (1) flume water; (
process water; (3) lime cake drainage; and (
Steffen or final waste when the Steffen process
used. A two year study on the containment, tre
ment, recirculation, and re-use of sugarbeet flu
ing and washwater was conducted within the ind
try. The particular system studied included two
ternately used first-ponds in series with a secc
pond. Removals of BOD and suspended sol
average 20 and 54% respectively, with the wa
continually increasing in BOD, COD, and total
solved solids the more it was recirculated. At
end of the processing season, system and surp
waters of initial 3000 ppm BOD and 6000 ppm
solved solids were discharged into a 1.8 surf
acerage, 15 ft deep pond having two surface a
tors, and degraded to 50 ppm BOD and 4 ppm D
Facultative instead of anaerobic digestion
longed the digestion period to 31 weeks. Inorg
nutrients were limiting, and were added
required. Water was not discharged from the
pond but used as fluming and wash water du
the next processing campaign. Control of temp
ture and pH is vital to odor control. Settle
solids can be removed but solids handling prod
greater odor problems which remain to be sol

RICKLING FILTER TREATMENT OF FOOD ANNING WASTE WATERS,
tional Canners Association, Berkeley, Calif.
Walter Rose.
oceedings, First National Symposium on Food ocessing Wastes, Apr 6,7,8, 1970, Portland, egon, Water Pollution Control Research Series, 12060--04/70, p 295-310. 9 fig, 3 tab.

scriptors: *Trickling filter, *Plastic, Toxicity, drogen ion concentration, Organic loading, emical oxygen demand, Biochemical oxygen de- nd, Biochemical oxygen demand, Nutrients, 'aste water treatment, Filtration, *Canneries, In- strial wastes.
ntifiers: Depth of packing, Food wastes.

ne conditions resulting in inadequate treatment ng provided by trickling filters are: sudden nge of volume and character of waste, haulting operations, deficiency of nutrients, and high ncentration of carbohydrates. These observa- ns were made during evaluation of the new stic filled trickling filters. The factors responsi- for actuating this research on these new filters wastes with high concentrations of soluble ds, necessity for microbial removal of soluble ds, need for high rate space saving treatment thod capable of withstanding high organic dings while still providing efficient removal. The ameters studied were: (1) toxicity, (2) rients, (3) pH, (4) organic loadings, and (5) th of packings. A description of this filter is en along with tables showing its performance ler constant and variable loadings. A high or low resulted in poor performance. The acceptable range was 6.5 to 8.0. An increase in the applied d caused a decrease in percent of BOD removal. lescription with an illustrative drawing of the ond filter which was used to study the effect of depth of packing on removal is given. The ults which are plotted in two curves show that removal was disproportionate to depth. This attributed to hydraulic loading 0.44 gpm/l sq. of cross sectional area and the use of high car- ydrates products. A description of the third r which used forced aeration is given. It was nd that the air flow rate is proportional to COD oval. Results of this study are tabulated. (See W71-08398) (Rayyan-Texas)

OD PROCESSING WASTE TREATMENT BY RFACE FILTRATION,
npbell Soup Co., Camden, N.J.
Louis Gilde.
ceedings, First National Symposium on Food cessing Wastes, Apr 6,7,8, 1970, Portland, gon, Water Pollution Control Research Series, 12060--04/70, p 311-326. 4 fig, 2 tab, 5 ref.

criptors: *Filtration, *Biochemical oxygen de- nd, *Nitrogen, Phosphorus, Agriculture, Cli- ology, Hydrogen ion concentration, Impervious s, Slope, Terraces, Conductivity, *Waste water tment.
ntifiers: *Food processing wastes.

s is a new overland flow technique by which ers sprayed on impervious or semi-pervious become purified by flowing through vegetative r on the surface of the soil and collect in ter- s at the bottom of slopes. A 3.5 MGD flow of te water is treated at the Paris, Texas factory of npbell Soup. A thorough description of this fac- is given. The study included climatology, ogy, chemistry and agriculture. The climatolo- study indicated remarkable similarity to the ther bureau records in the east. Thus the latter ld be used in predicting the grass growth rate in e areas. Analysis of the grass grown on the osal site showed high nutritional values ranging o 23% protein with the hay value being about 8% of the operating cost. Analysis of the effluent indicated a 99% BOD, 90% nitrogen and 45% phosphorus removal. However, a long rest period resulted in 90% phosphorus removal without affecting the BOD or nitrogen. The pH (constant, neutral effluent) and the electric conductivity are illustrated in two figures. A summary of the hydrological data is given. Biological studies indicated that as temperature decreases the number of organisms increases. A 175 ft. down hill slope with a 2%-6% pitch was found to provide sufficient treatment. BIOLOGICAL TREATMENT OF FOOD PROCESSING WASTES,
Stanford Univ., Calif.
Perry L. McCarty.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series, No 12060--04/70, p 327-348. 5 fig, 1 tab, 18 ref.

Descriptors: *Biological treatment, *Aerobic conditions, *Anaerobic conditions, Microorganisms, Kinetics, Bacterial, Utilization, Sludge, Nutrients, Methane, Growth rate, Decay rate, Substrate, Velocity, Filter, Fungi, Organic, *Waste water treatment.
Identifiers: *Food processing wastes.

This is a summary of the basic principles of biological treatment which have been applied and discussed during the symposium with emphasis on an aerobic process. The major factor in designing a biological treatment system is the reproduction rate of the microorganisms involved. Failure point of the process could be evaluated by considering the kinetics of bacterial growth and waste utilization. A discussion with illustrative drawings and tables ot these factors is presented. Formulas with discussion on excess sludge production, nutrients, and air requirements and methane production are given. The generally used factor of safety against failure is 3-20 times the minimum solid retention time. The biological growth rate coefficient for aerobic system is .3-.4 lb per lb BOD5 or COD consumed and the organism decay rate is .02-.06 per day. The maximum substrate removal velocity was 4-24 lb BOD5 per day per pound of microbial mass. The substrate removal velocity indicates that more waste could be treated per day in a given reactor by increasing the concentration of microorganisms or mixed liquor volatile solids. The anaerobic process has not been widely used. A new system called the anaerobic filter has been developed. A discussion on the operation of this filter is presented with the conclusion that it seems ideal for many food processing wastes but more studies are needed. Comments on food processing waste treatment are presented. (See also W71-08398) (Rayyan-Texas)
W71-08414

WURDD'S TASK FORCE ON AGRICULTURAL POLLUTION,
Agricultural Research Service, Albany, Calif. Western Utilization Research and Development Div.
J. Peter Clark.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 347-349.

Descriptors: *Pollution, *Foods, *Water reuse, Toxicity, Oil, Brines, Environment, Water pollution control, Waste water treatment, *Farm wastes.

The plan of action and the specific research of the task force of WURDD is presented along with a general introduction to some other pollution related research conducted by the division. Modifying food processing is a most promising approach to reducing pollution from agriculture. The general principle to this concept is minimize water use, recycle water or other liquids where possible, put as much of the raw material into the final product as possible, and make soluble material from whatever cannot go in the primary product. The author considers the present waste stream analysis by the measurement of BOD, COD, SS, etc. inadequate and suggests the analysis of the composition of the stream and its relationship to the environment. Some of the studies done by the division are those on the wastes of castor oil which used to be believed toxic to all animals but was found to be a good nutrient for fish. Also, the study on enzymes and the possibility of growing the useful ones on waste streams and using enzymes to convert or treat waste streams is mentioned along with other current studies. (See also W71-08398) (Rayyan-Texas)
W71-08415

IN-FIELD PROCESSING OF TOMATOES,
Agricultural Research Service, Albany, Calif. Western Utilization Research and Development Div.
R. Joseph Wayna.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series, No 12060--04/70, p 350-354. 1 fig, 8 ref.

Descriptors: *Harvesting, *Tomatoes, Hydrogen ion concentration, Heating, Acid, Solid wastes, Waste water, Cooling, *Waste water treatment.
Identifiers: Food wastes.

5-7 million tons of tomatoes of which 90% are machine harvested are delivered annually to the canneries in the U. S. A description of the machine harvesting and economical and ecological advantages and disadvantages are discussed. It was found that the best way to achieve the utmost yield with the least waste from tomatoe processing is to reduce the in-transit and holding periods by processing the tomatoes in the rural harvesting areas. A tomato processing unit was built with the objective of field processing and the application of a new acidified tomato juice. The unit performed the following: (1) preparation of tomatoes, (2) hot-break for rapid enzymes destruction, (3) the optional acid treatment, and (4) pulping and cooling. It was found that prompt processing resulted in a 6-12 % increase in product yield. Also, an increase of 4% solids recovery resulted from the use of acid extration and heat treatment over the use of heat treatment alone. All waste material including waste water was disposed on nearby farm land. Juice is the only product to be transported. For stability purposes and at neutral pH (4.4) the juice should be chilled to 40F but it could be held for 24 hours at 70F at a pH of 2.75 without any significant effects. (See also W71-08398) (Rayyan-Texas)
W71-08416

DRY CAUSTIC PEELING OF VEGETABLES AND FRUITS,
Agricultural Research Service, Albany, Calif. Western Utilization Research and Development Div.
P. Robert Graham.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series, No 12060--04/70, p 355-358. 2 ref.

Descriptors: Infrared, Heating, Brushing, *Potatoes, *Fruit, Water pollution control, Economics, *Waste water treatment, Farm wastes, Vegatable crops.
Identifiers: *Food wastes.

The study of the dry caustic peeling was done on white potatoes. The process is described in detail but could be summarized by: (1) potatoes are treated with hot lye; (2) they are subjected to infrared heating; and (3) they are then brushed. The experimental unit was composed of a live-roller conveyer, infrared burners and rubber tipped rolls for peeling. The amount of peel removed could be controlled by the caustic dip time. No heat rings were produced under proper conditions. Peeled

potatoes were dipped in sulfite to prevent darkening. Peeling conditions for sweet potatoes are the same as those for white potatoes except the brushing state following the stud rubber peeler is somewhat critical. As for fruit, a caustic chip similer to that used for conventional peeling is used with a rubber disk peeler and no infrared heating. This method proved to be successful on peaches, pears, and apricots. In general the dry caustic peeling method helps in keeping the peel material from entering the plant effluent as well as resulting in revenue in excess of the savings through control of water pollution. (See also W71-08398) (Rayyan-Texas)

PILOT PLANT EXPERIENCES OF USDA-MAGNUSON DRY CAUSTIC PEELING PROCESS,
Magnuson Engineers, Inc., San Jose, Calif.
J. Traver Smith.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--4/70, p 359-361.

Descriptors: Infrared, *Waste water treatment, *Solid wastes, Pilot plant, *Potatoes, Fruits, Hydrogen ion concentration, Idaho, Farm wastes.
Identifiers: *Caustic peeling, Magnuscrubber, Magnubrusher, Food wastes.

This pilot plant of dry caustic peeling was constructed at Aberdeen, Idaho. The units used were: (1) small ferris wheel type conventional caustic dip units holding belt; (2) infrared unit, (3) magnuscrubber, and (4) magnubrusher. The product used was white potatoes. Caustic solution of 12% with one minute dip was used. The peel waste was of 23-25% solids at pH 11. Potatoes were dipped briefly in a 0.5% sodium bisulphite solution to fix the color. The infrared caustic peeling process definitely accomplished the objective of keeping the peel waste out of the plant waste water. Other advantages include reduction of chemical required reduction of peel waste, and production of whiter and non-slippery processed potatoes. Processing of sweet potatoes using the Magnuson equipment was also found to be successful. Other products are still in the experimental stage. Dry caustic peeling is also called, 'USDA-magnuson anti-pollution peeling system' and also 'infrared caustic peeling.' (See also W71-08398) (Rayyan-Texas)

POSSIBLE USES OF UNI-FLOW FILTER,
Agricultural Research Service, Albany, Calif. Western Utilization Research and Development Div.
Karel Popper.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 362-376.

Descriptors: *Filters, *Pressure, *Solid wastes, Liquid wastes, *Cotton, *Waste water treatment, Economics, Farm wastes, Water reuse.
Identifiers: Suspended solids.

The idea of the uni-flow is to remove some of the noxious material from the effluent at low cost and render the effluent valuable or reusable. The uni-flow utilizes the idea of low pressure to separate solids from liquids by the use of cotton tubing (or nylon tubing). A description of the unit is given with illustrative pictures. An example with discussion on the use of the unit in water softener regenerant is presented. Another example is the use of the unit on wine lees. A 50 gpm unit at a cost of $800 was built. Economic study showed that through use of this unit a recovery of 1000 gallons of wine will require an expenditure of one cent in facilities. The unit was used successfully on potatoe starch with a SS removal of 98%. Other examples of the use of the unit are given. (See also W71-08398) (Rayyan-Texas)

A CASE HISTORY IN FOOD PLANT WASTE WATER CONSERVATION AND PRETREATMENT EXPERIENCE,
Artichoke Industries, Inc., Castroville, Calif.
Granville Perkins.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 377-382.

Descriptors: *Precipitation, Flotation, Biochemical oxygen demand, Hydrogen ion concentration, Hydraulic flow, *Waste water treatment.
Identifiers: Suspended solids, *Food wastes.

This is the history of the waste water treatment problem in an artichoke plant in Castroville, California. The plant started in 1955 using the Castroville County treatment plant which was designed at an average capacity of 300,000 gpd and peak hydraulic load of 900,000 gpd. The plant flow in 1955 was 100,000 gpd and jumped to 400,000 gpd in 1958. A water re-use program reduced the flow to 300,000 gpd but BOD increased from 1500 ppm-4000 ppm. In 1964 an ordinance limiting the gallons of waste and pounds of BOD per industry was issued. The limit of the artichoke plant was 60,000 gpd and 240 lb of BOD at no fee. A consultant was hired to study pretreatment. The result was a chemical precipitation system. This system started operating in 1967 and after one year the value went down to 80,000 gpd with a BOD between 600-1000 ppm. Due to chemical addition the pH jumped from 5.5 to 11 which caused the malfunctioning of the clarifiers of the district treatment plant. Stopping the addition of chemicals allowed the clarifiers to start functioning again but the BOD jumped to 2000 ppm. A new consultant was hired and he suggested flotation of the SS followed by precipitation. This is now under way by converting the 6000 gallon precipitator into an 8000 gallon clarifier. ANIMAL FEEDS FROM VEGETABLE WASTES,
Agricultural Research Service, Albany, Calif. Western Utilization Research and Development Div.
O. George Kohler.
Proceedings, First National Symposium on Food Processing Wastes, Apr 6,7,8, 1970, Portland, Oregon, Water Pollution Control Research Series No 12060--04/70, p 383-387.

Descriptors: *Lignin, *Digestion, Alkali treatment, Dehydration, Grass, Vegetable crops, *Farm wastes, Economic feasibility, *Waste water treatment.

This is a program report on two agricultural waste problems: The lignified cellulosic material and the non-edible green waste. Lignin, an indigestible substance is associated with the cell wall cellulose and hemicellulose and tends to decrease their digestability. This digestability could be improved by processing straws through treatment. Alkali treatment of a variety of lignified cellulosic wastes and manure improved their digestibility. Studies on the cauliflower plants using a Freeze-dried method indicated that the leaf fraction is a promising poultry feed (28% protein and 12.5% fiber), while the stem fraction is good as a cattle feed with 86.3% digestibility. Economic evaluations of treated straw products and cauliflower waste products are being carried out by computer. (See also W71-08398) (Rayyan-Texas)

CHARACTERISTICS AND KINETICS BIOLOGICAL FIXED FILM REACTORS,
Clemson Univ., S.C. Environmental Systems gineering.
Billy H. Kornegay, and John F. Andrews.
Available from the National Technical Informa Service as PB-199 834, $3.00 in paper copy, $0 in microfiche. 1970. 212 p, 45 fig, 32 tab, 115 FWPCA Research Grant No WP-01181, Prog 17050--00/70.

Descriptors: *Trickling filter, *Design crit *Kinetics, Dissolved oxygen, Mixing, Satura Diffusion, Biodegradation, Oxidation, Mathen cal models, Microorganisms, Waste water t ment.
Identifiers: *Biological bacterial film, *Plug f Glucose, Thickness, Suspended solids.

The kinetics of biological slime films were vestigated using six completely mixed, an reactors. Design criteria for trickling filters formerly based on experience and guesswor this investigation attempted to determine kinetics of a simple system to provide a better for establishing trickling filter design criteri simple glucose and mineral base substrate wa to microorganisms attached to the walls of the nular, completely mixed reactors. The rea were operated first in parallel, for a basic inve tion of biological film kinetics, and second, ries, to approximate plug flow. Completely reactors eliminated channeling, dissolved o and substrate gradients, and the interdepend of velocity and flow. Film development uniform, and liquid channeling did not occur investigation revealed that biological films de in three distinct stages: (1) logarithmic g which lasted until the active thickness was rea (2) linear growth, between the active thickne the plateau thickness; and (3) zero growth, new cells are washed away. The active thickness averaged 70 and was independent O. Kinetic equations were developed which sh good correlation between theoretical and obs data. On this basis, a trickling filter design tion, based on the kinetics of the proces developed. (Lowry-Texas)

AN INVESTIGATION OF INDUSTRIAL MUNICIPAL WASTE WATER QUAN COMPOSITION, AND TREATMENT IN REEDY RIVER BASIN,
Clemson Univ., S.C. Environmental Syste gineering Program.

mes M. Campbell.
S Thesis, Clemson University. 60 p, 9 fig, 3 tab, ref. OWRR Project B-017-SC (2).

escriptors: Water quality control, *Waste assimilative capacity, Industrial wastes, Municipal astes, Nutrients, Color, Toxicity, Biochemical oxen demand, Hydrogen ion concentration, Dissolved oxygen, Aeration, Odors, Analytical chniques, Tertiary treatment, Sewers, *Waste ter treatment, South Carolina, *Water pollution urces.
ntifiers: *Reedy River Basin, Textile wastes.

lustries and municipalities discharging treated or treated effluents into the Reedy River Basin re surveyed as to waste volume, strength, and er characteristics. By conventional evaluations D. O., BOD, and pH, the River was in acceptable ndition. Visual observation discounted the alytical evidence, however, and it was deterned that the tests developed primarily to muipal wastes were not applicable to the strong tex- wastes being discharged to the basin. As a result he data gathered from the questionnaires, it was cided that there were four choices open to the in authority, including: (1) expansion of existing nts; (2) construction of an all new regional plant combined municipal and industrial wastes; (3) nstruction of a new, centralized textile waste atment plant to handle most of the industrial tes in the area; and (4) pumping all wastes into Reedy River Basin, and adding artificial aera- and odor control to the river, since it would be entially an open sewer. The last alternative, ng by far the least expensive would probably be hibited by state and federal law, public opinion, aesthetic value loss. No one system has been igned and evaluated for construction as yet, but alternatives are clearly established. (Lowry-as)

tifiers: Differentiation, Citric acid cycle, Inulation.

fferent enzyme activities namely 6-PFK, LDA, -PDH, 6-6-PDH, 1 CDH, and MDH were utilto differentiate among the following clostridi- strains: (1) CE 30; (2) CE 3; (3) steurainum, (4) AB-6-7, (5) C.butyricum; (6) auvoei; (7) C novyi, and (8) C. septicum. This erentiation was made possible by the fact that strain shows characteristic enzymatic activity. he organisms studied, all contained 1-phosphokinase (1-PFK); three lacked 6-PFK and man- 1-phosphate dehydrogenase. The hexose ophosphate shunt was present in 6 clostridia, rmined by the presence of glucose 6-phosphate ydrogenase. Clostridium septicum was the only nism studied which gave indications of posing the full critic acid cycle, with most of the r strains either the first of the four carbon part only the active segments. The advanced detection methods have made differentiation of different strains by the enzymatic activity method a useful and accurate laboratory tool. (Lowry-Texas)

RECOVERY OF MICA FROM SILT DEPOSITS IN THE NOLICHUCKY RESERVOIR, TENNESSEE,
Bureau of Mines, Tuscaloosa, Ala. Tuscaloosa Metallurgy Research Center.
Ralph B. Adair, and Jerome O. Crabtree.
Bureau of Mines Report of Investigations RI 7488, Mar 1971. 9 p, 2 fig, 9 tab.

Descriptors: *Reservoir silting, *Mine wastes, *Desilting, *Silicates, *Tennessee, Byproducts, Mining, Reservoirs, Dredging, Sedimentation, Mineralogy.
Identifiers: *Mica, *Nolichucky reservoir (Tenn).

The Bureau of Mines conducted laboratory batch and small-scale continous tests on samples of silt from the Nolichucky Reservoir near Greenville, Tenn., to develop a process for the recovery of commerical-grade muscovite concentrates. Using a combination of Humphreys spirals for preconcentration followed by cationic flotation, 94.5% of the muscovite was recovered in a product containing 96.5% muscovite. Based on sedimentation soundings over the years, approximately 61.88 million cubic feet of mica-laden sediments lie above the present maximum pool level. Using the 61.88 million cubic feet and a measured average density of 75 pounds per cubic foot, this would indicate a minimum of 2.32 million tons of mica-bearing silt. Using 11% mica, as determined by average sample grade, this represents 255,200 tons of mica. It should be noted that the estimate is based on an average depth of 6.34 feet, whereas most of the deposits extend to depths of over 20 feet, and that deposits below the water line could not be sampled. (Woodard-USGS)

THE EFFECT OF DETERGENTS ON GAS ABSORPTION PROCESSES,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
Jerry A. Caskey, Ralph F. Herbert, and Yan Pui To.
Available from the National Technical Information Service as PB-199 830, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Center Bulletin No 35, Apr 1971. 58 p, 20 fig, 36 ref, append. OWRR Project A-025-VA (2).

Descriptors: *Surfactants, *Absorption, *Surface tension, *Detergents, Carbon dioxide, *Oxygenation.
Identifiers: *Interfacial resistance.

Although many studies have been made showing that surfactants can lower gas absorption rates the mechanism by which this occurs is not known. The purpose of this investigation was to show what effect the hydrophilic functional group has on gas absorption rates. Four different biodegradable surfactants were used. All four are used in commercial formulations. All four surfactants also had a linear hydrophobic group of 12 carbon atoms. In addition the position of the hydrophilic functional group was studied using 1-octanol and 4-octanol. Pure surfactants were used so that the interfacial resistance could be related to the surface concentration by means of Gibbs' adsorption isotherm. A quiescent liquid manometric gas absorption cell was used for the study. Carbon dioxide and water were used as the absorption system. Dodecyl sodium sulfate, dodecyl benzene sodium sulfonate, dodecyl diethanol amide and dodecyl diglycol amide were the four surfactants studied with different hydrophilic groups. The interfacial absorption resistance caused by the surfactant decreased with increasing molecular weight of the hydrophilic portion of the molecule. The interfacial resistance increased as the hydrophilic group moved from the end toward the center of the linear alkyl hydrophobic chain. (Caskey-VPI)

MARINE FOULING IN POWER STATIONS,
Central Electricity Generating Board, Southampton (England). Marine Biological Lab.
Nicholas Holmes.
Marine Pollution Bulletin, Vol 1 (NS), No 7, p 105-106, July, 1970.

Descriptors: *Chemcontrol, *Fouling, *Mussels, *Cooling water, *Chlorination, Invertebrates, Mollusks, Shellfish, Worms, Annelids, Tubificids, Environmental engineering, Thermal stress, Equipment, Water cooling, Water pollution sources, Inhibitors, Protective coatings, Chlorine, Treatment, Water flow.
Identifiers: Barnacles, Hydroids, Balanus sp., Antifouling paint, Byssus threads.

The biological fouling problem in seawater coolant systems of electricity generating plants is briefly reviewed. Four preventative measures are discussed: periodic flushing with heated water, flushing with fresh water, use of antifouling paints, and continuous chlorination. The last is considered to approach the ideal as an industrial technique, because it is fairly cheap, is very effective, and has a minimal effect on the environment. (LeGore-Washington)

MUSSEL FOULING IN CHLORINATED COOLING SYSTEMS,
Central Electricity Generating Board, Southampton (England). Marine Biological Lab.
N. Holmes.
Chemistry and Industry, p 1244-1247, 26 Sept, 1970. 8 fig, 2 ref.

Descriptors: *Chemcontrol, *Fouling, *Mussels, *Chlorination, *Cooling water, *Water flow, *Inhibitors, Invertebrates, Mollusks, Shellfish, Environmental engineering, Equipment, Water cooling, Water pollution sources, Chlorine, Treatment, Biochemistry, Physiological ecology, Animal physiology, Environmental effects, Commercial shellfish, Industrial water.
Identifiers: *Marine engineering, Power plant design, Byssus threads, Mytilus edulis.

The fouling problem presented by mussels in marine cooling water systems is discussed with emphasis on settlement and on byssus thread formation. The chlorinated cooling systems of two power stations are described, and mussel fouling within them is localized relative to water flow rates present. Both power plants are closed down for several hours each night, implying that the flow-dependent fouling patterns were due to differential removal of settled mussels as well as to differential obstruction of larval settlement. It is suggested that mussel control is accomplished in chlorine residuals of 0.5 mg/l at average water speeds greater than 1.5m/sec. This is attributed to partial interference of byssus thread formation by chlorine, resulting in the mussles' inability to effectively attach to the substrate. (LeGore-Washington)

Descriptors: Oxygen, Absorption, *Foaming, *Aeration, *Cytological studies, Farm wastes, Waste water treatment, *Biological treatment.
Identifiers: Waldorf aerator, Cell growth, *Whey.

Cheese whey containing 35,000 ppm BOD is the most concentrated liquid waste that can be found in large quantities. It foams excessively when bubbled with gas. Cheese whey was successfully treated in a Waldhof aerator by Saccharomyces fragilis. This yeast can reduce about 85% of the BOD and produce single cell protein. A batch as well as a continuous growth process of this yeast was successfully developed. A fundamental study on the transient and steady state behavior of cell growth was also conducted. Through computer simulation, it was possible to predict growth pattern in batch and continuous processes. Oxygen is important in any aerobic biological process. The Waldhof aerator not only provides good aeration for yeast growth, but is also capable of handling highly foamy liquors like whey through its foam recycling mechanism. A sysmetical study on the working mechanisms of a Waldhof aerator was conducted. Foam fractionation of the yeast and other microbiological cells was also studied. Foam decay was found to follow a second-order rate pattern. A theoretical investigation was conducted on gas-liquid interfacial oxygen absorption. The effect of viable microbiological cells that consume the transferring solute on the rate of oxygen absorption was analyzed.

Identifiers: Colorado Springs (Colo), Recycled water.

In treating waste water, characterization of raw waste is necessary to set process conditions near optimum. A biological seed acclimated to the waste tested is necessary; nitrogen and phosphorus are essential in minimum quantities, which are conveniently added at the same time as the feed; oxygen is also required. Many chemicals such as lime, iron, and aluminum salts, as well as the newer polyelectrolytes, have shown a striking ability to coagulate finely divided colloidal solids; various natural coagulants have shown similar properties. Since biological treatment of vinyl resin wastes was inadequate to meet regulatory requirements, chemical treatment was also used. The combined biological and chemical treatments removed 97% of the biochemical oxygen demand, and suspended solids resulting in effective treatment of raw waste. Aeration equipment, solids-contact equipment, gravity clarification, dissolved air flotation, granular media filtration and sludge dewatering are calculated and described. Reuse of treated waste water to meet requirements is often economical. Two examples of water reuse and reclamation are given. By-product recoveries may represent substantial credit to the overall costs. Recovery of coal and of spent grains for animal feed or protein for human consumption in the brewery industry are examples. (Jones-Wisconsin)

WASTE WATER CONTROL FACILITIES IN A PETROCHEMICAL PLANT,
Union Carbide Corp., South Charleston, W. Va.; and Union Carbide Corp., Ponce, Puerto Rico.
J. E. Rucker, and R. W. Oeben.
Chemical Engineering Progress, Vol 66, No 11, p 63-66, 1970. 1 fig, 3 tab, 2 ref.

Descriptors: *Waste water treatment, *Construction costs, *Chemical wastes, Industrial plants, Water pollution control, Design criteria, Personnel, Equipment, Industrial wastes, Puerto Rico.
Identifiers: *Petrochemical wastes, Union Carbide Corporation, Ponce (Puerto Rico), Waste loads.

The Union Carbide Corporation's petrochemical plant addition at Ponce, Puerto Rico, is planned to include installation of a primary and secondary biological treatment plant for waste water from both existing and new facilities. New facilities contain equipment for recycle and product recovery. Engineering efforts to further minimize waste effluents continue through all phases of design for each production unit and operation of the new units. Aqueous pollution control represents a total investment of $12.8 million. Operating pollution control personnel, training, and design criteria are tabulated. Methods used for determining waste loads and process design of the terminal facilities, including instrumentation and control procedures, are described. Determination of total waste water load was based on flow measurement and laboratory analysis of waste streams from the existing plant plus estimates of aqueous waste loads from new units. Waste water load removal design was planned to avoid taking waste streams into the terminal treatment plant without first investigating known alternative disposal methods. The sewer system is designed to segregate storm or fire water from process waste water streams. Monitoring is provided at the treatment facilities by an operator on duty around-the-clock. (Auen-Wisconsin)

FEASIBILITY OF ALTERNATIVE MEANS OF COOLING FOR THERMAL POWER PLANTS NEAR LAKE MICHIGAN.
Federal Water Quality Administration, Corvallis, Oreg. Pacific Northwest Water Lab.

Department of the Interior, Federal Water Quality Administration, Aug 1970. 112 p, 4 fig, 38 tab, 73 ref.

Descriptors: *Feasibility studies, *Water cooling, *Thermal powerplants, *Lake Michigan, Economic feasibility, Technical feasibility, Environmental effects, Ponds, Canals, Condensation, Cooling towers, Evaporation, Costs.
Identifiers: *Waste heat, Cooling systems.

The feasibility was evaluated of dissipating waste heat from thermal power plants located near Lake Michigan. Consideration was given to the following methods: evaporative towers with either mechanical or natural draft, cooling ponds, spray cooling canals, and dry cooling towers with either natural or mechanical draft. The study area, Lake Michigan, was subdivided into four sections to compensate for the effect of climatic conditions. The analysis of meteorological, economic, engineering, and environmental aspects indicated that any of the investigated cooling systems are feasible alternatives for power plants on Lake Michigan. The maximum economic penalty of 9-10% was for dry towers, whereas the minimum of about 1%--for cooling ponds and spray canals. (Wilde-Wisconsin)

Descriptors: Waste water treatment, *Activated sludge, *Chemical precipitation, *Phosphorus, *Aluminum, Biological treatment, Sludge.
Identifiers: *Alum, *Aluminate, Suspended solid.

Liquid alum and sodium aluminate were utilized for phosphorus removal at 1.0 and 0.2 million gal/day activated sludge municipal waste water treatment plants. Phosphorus removals were determined at aluminum to phosphorus ratios up to a limiting point which exhibited a minimum total soluble phosphorus residual of about 1.0 mg/liter. More efficient use of chemical and higher phosphorus removal efficiencies are obtained in a multistage activated sludge system. The type of activated sludge system also influenced chemical phosphorus removals. Excessive effluent suspended solids were found to be more a function of the volatile solids produced to aluminum added ratio than of exceeding a given aluminum to phosphorus ratio or aluminum dosage. The added chemical serves as a weighting agent in the activated sludge and fully compensates for the additional solids mass to be handled both in terms of system hydraulics and solids handling. Batch studies indicate that aluminum as alum will outperform iron as ferric chloride on a performance/cost basis and that the best point of addition is just before solids-liquid separation. The considerations involved in this type of phosphorus removal system are discussed. (Mulbarger-EPA)

Descriptors: *Waste disposal, *Municipal wastes, *Waste treatment, *United States, *Reviews, Methodology, Sanitary engineering, Landfills, Hydrology, Water pollution, Path of pollutants, Mine wastes, Geology, Groundwater, Water quality, Compaction, Compressibility, Solid wastes, Incineration, Percolation, Seepage.
Identifiers: *Landfill hydrology.

Technical and economic aspects of community refuse disposal systems and their effects on the environment are identified and described. Seven landfills and two incineration systems, located throughout the United States, are reviewed. For example, a solid wastes landfill stabilization project conducted for the city of Santa Clara, Calif., proved that aeration of sanitary landfills provides more rapid stabilization, greater refuse density following compaction, the conservation of landfill space, and elimination of vermin and bacteria by high-temperature oxidation. DISPOSAL OF WASTES FROM WATER TREATMENT PLANTS--PART 2,
American Water Works Association Research Foundation, New York.
Harry A. Faber, and Kitty C. Klomp.
Journal American Water Works Association, Vol 61, No 11, p 619-638, 1969.

Descriptors: *Waste water treatment, *Waste disposal, *Water works, *Water treatment, Water softening, Chemical precipitation, Sludge, Dialysis, Coagulation, Freezing, Centrifugation, Brine disposal, Cation exchange, Separation techniques, Water pollution, Ultimate disposal, Costs, Sludge disposal, Sludge treatment, Legislation.
Identifiers: Alum sludge, Sanitary sewers, Vacuum filtration, Sand bed, Wedge wire drying, Filter pressing, Softening sludge, Reclaiming lime, Wash-water wastes.

Current information on and improved techniques to solve the problems of water treatment plant waste disposal and regulatory aspects are given. Since alum is prime coagulant in U S water plants, disposal of sludge is of primary consideration. Discharge of water treatment plant wastes directly to surface waters is impractical. Among various methods of water treatment waste disposal discussed are lagoons, discharge to sanitary sewers, a freezing process (operated in the United Kingdom), the advantages of the centrifuge method, vacuum filtration, sand drying beds, treatment by filter pressing, larging to seas, pipeline transport, and cost of alum recovery. Disposal of filter wash-water, disposal of sludge from softening plants, including lagoon treatment, sewer discharge, and lime reclamation, together with disposal of brines are also deliberated, together with the status of plant operation and regulatory aspects. Naples Univ. (Italy). Instituto di Igiena.
E. Campanile, V. Ferro, E. DeSimone, S. Grasso, and R. DeFusco.

Revue International d'Oceanographie Medicale, Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Institut National de la Sante et de la Recherche Medicale, Fondation de la Ville de Nice, Nice, Vols 18 and 19, 1970, p 117-124.

Descriptors: Water pollution control, *Self-purification, *Bacteria, Sea water, Water treatment, Micro-organisms.
Identifiers: *Lytic strains, *Bdellovibrio bacteriovorus.

Bacteriological research on Bdellovibrio bacteriovorus in sea water indicated, with some frequency and constancy, the presence of colonies which can bring on the lysis of some test bacteria. This phenomenon and its possible intervention in self-purification led to further studies on the nature of lytic strains and their capabilities in self-purification. Research of lytic strains is much easier when the culture medium is low in nutrients. Temperature, nature and way of innoculation of test-bacteria influence the test value. The time parameter is variable from one strain to another and is also variable within each individual strain. Isolated lytic strains showed a certain preference for gram-positive terrestrial germs, however, some act against both gram-negative and gram-positive bacteria. (Ensign-PAI)

Descriptors: *Self-purification, *Bacteria, Water pollution control, Seawater, Fresh water, Sewage, Pathenogic bacteria, Water treatment.
Identifiers: *Bdellovibrio bacteriovorus, *Salmonella typhi, *Pseudomonas aeruginosa.

The role of Bdellovibrio bacteriovorus in the process of self purification in sea water, fresh water and sewage water was studied. Test-germs used were Salmonella typhi (Vi strain) and Pseudomonas aeruginosa. B. bacteriovorus was found to be more frequent after samples were enriched with the host bacteria and was more abundant in sewage than fresh water and least abundant in sea water. Lytic action of B. bacteriovorus in relation to P. aeruginosa is discussed. Epidemiological aspects in studying the action of B. bacteriovorus on certain gram negative germs, pathogens towards man, are considered. (Ensign-PAI)

PUBLIC HEALTH ASPECTS OF INDIVIDUAL WATER WELLS,
Monroe County Health Dept., Mich.
J. C. Hancock.
Groundwater, Vol 1, No 3, p 27-29, July 1963. 1 tab, 4 ref.

Descriptors: *Water wells, Water quality, *Michigan, *Public health, *Standards, Water pollution control.
Identifiers: Water well construction code, Shigella infections, Shallow wells.

Local government in Michigan, and perhaps in other states, must try to bring the best thinking there is concerning solutions to health problems which are within their legally designated area of responsibility. One such local health department activity in Michigan is the construction and operation of private individual water well systems. Monroe County, which is just beginning to feel the effects of the suburban spillover from Detroit Michigan, and Toledo, Ohio, recognized, in 1961 the need for regulation of such water well systems. The subsequent development of a Code, and its enforcement have made us realize that we are just beginning to fully understand a subject which is much broader in scope from a public health standpoint than just construction details and bacteria tests. AIIE Transactions, Vol III, No 1, p 7-12, Mar 197 6 p, 4 fig, 26 ref. OWRR Project A-012-GA (4) a A-023-GA (2).

Descriptors: *Dynamic programming, *Wa quality control, *Optimization, *Costs, *Waterp icy, *Organic wastes, *Temperature, Dissolved oxygen, River basins, Biochemical oxygen dema Resource allocation.

Interrelated quality characteristics for a river ba were considered in the formulation of a dynam programming model to minimize total cooling a treatment costs. The specific water quality param ters selected for study were dissolved oxygen a temperature which were affected principally by ganic and thermal wastes, respectively. A sketch a generalized river basin was shown and th shown again as a series of discrete reaches. It necessary to consider three system boundaries: the upstream limit of the system, (b) downstream limit of the system, and (c) boundar of individual reaches between (a) and (b). problem was formulated as a resource allocat problem where the resource being allocated the natural capacity of a stream to assimilate th mal and organic waste and then as an initial-va dynamic programming problem. Temperatu temperature rise, and dissolved oxygen were c strained at each stage. The cost functions for b cooling and treatment were well behaved, and c straints were such that the feasible regions w reduced significantly. It was noted that this mo should be useful in evaluating the effects of the cation of another waste source on a river. (K Cornell)

tifiers: *Economic incentives.

ng the recent intensification of interest in in-rial water-pollution abatement, this publication siders alternative federal programs to provide stry with financial incentives to abate water ution. The article examines: (1) financial in-ives proposed in Congress, (2) tax preferences ing to marginal companies, (3) reasons sup-ing tax preferences, (4) opposition to tax erences, (5) alternatives to tax preferences, (6) questions for citizens to consider. The uation focuses primarily upon external, 'carrot-' tax incentives. The merits and relative impact ccelerated depreciation methods and invest-t tax credits are considered. Six arguments sup-ng tax incentives are presented, and ten argu-ts in opposition are listed. User charges, cting the burden imposed on the community, effluent charges, covering all damages result-rom industrial wastes, are evaluated as 'stick-' alternatives to tax preferences. In conclusion, ries of nine questions as to who will pay for in-rial water-pollution abatement are presented, g with a list of nine informational publications ilable to laymen. (Earl-Florida)

ACID MINE DRAINAGE FORMATION AND ABATEMENT.
Ohio State Univ., Research Foundation, Columbus, Ohio.

Available from the National Technical Information Service as PB-199 835, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series, DAST-42, Apr 1971. 82 p, 7 fig, 69 ref. EPA Program 14010 FPR-04/71.

Descriptors: *Acid mine water, *Pyrite, *Oxidation, *Pollution abatement, Ferrobacillus, Underground streams, Mine wastes, Water pollution control, *Mine drainage, Mining, Iron bacteria, Chemical reactions, Kinetics.

This report pertains to at-source control of pyrite oxidation. The current level of knowledge of acid mine drainage formation is critically reviewed, with emphasis on reaction kinetics and reactant and product transport. A reaction system model is developed which provides a conceptual framework for subsequent discussion dealing specifically with the physical, chemical, and biological characteristics of pyritic systems encountered in mining situations. Practical considerations of at-source control of acid mine drainage formation in underground mines, spoil banks, and refuse piles are presented in the final section. Deficiencies in current knowledge include: Descriptions of the physical environment existing at pyrite oxidation sites in natural systems are far more incomplete that the current understanding of pyrite oxidation kinetics; oxygen transport is poorly described at this time, but is probably the rate-controlling factor in most instances; serious questions exist as to the effectiveness of air-sealing techniques as currently practiced; the significance of bacterial catalysis of pyrite oxidation under field conditions has not been established.

EFFECTS OF ARTIFICIAL DESTRATIFICATION ON DISTRIBUTION OF BOTTOM ORGANISMS IN EL CAPITAN RESERVOIR,
California State Dept. of Fish and Game, Sacramento. Inland Fisheries Branch.
Alex Calhoun, Paul Hubbell, and Arlow Fast.
California Department of Fish and Game, Fish Bulletin 148, 1970. 30 p, 17 fig, 5 tab, 24 ref.

Descriptors: *Aquatic habitats, *Biomes, *Ecological distribution, *Stratification, *Dissolved oxygen, *Hypolimnion, *Limiting factors, Ecology, Environmental gradient, Distribution patterns, Food webs, Dominant organisms, Niches, Thermal stratification, Epilimnion, Reservoirs, Spatial distribution, Benthic fauna, Clams, Oligochaetes, Diptera, Nematodes, Invertebrates, California.
Identifiers: *Artificial enhancement, Enhancement, Destratification, Midge larvae, El Captian Reservoir.

The bottom fauna of El Capitan Reservoir, San Diego County, California, was sampled during 1964, under normal conditions, which included prolonged stratification. The lake was then destratified artificially by injection of compressed air for two years. The benthic organisms rapidly invaded the profundal zone, in which they had previously been absent. Their total numbers in the lake increased dramatically. A combination of anoxia and toxicity in the hypolimnion had presumably excluded them from the deeper parts of the lake when it was stratified. In 1967 the lake was permitted to stratify again. By August the normal summer distributional pattern of bottom organisms was beginning to re-appear. Extending the distribution of midges throughout the lake by artificial destratification should increase the amount of flood available to game fish. The long term implications of artificial destratification for reservoir fishery management are discussed. (LeGore-Washington)

Available from NTIS PNE-1009. PNE-1009, Mar 12, 1971. 38 p, 5 fig, 10 tab, 13 ref. AEC Contract AT (29-2)-1229.

Descriptors: *Groundwater movement, *Permeability, *Sandstones, *Radioisotopes, Nuclear explosions, Excavation, Natural gas, Soil contamination, Water pollution, Strontium radioisotopes, Tritium.
Identifiers: Cesium radioisotopes.

Groundwater in the Ojo Alamo Sandstone could mix with other water along the San Juan River near the mouth of Los Pinos River, 38 kilometers northwest of the Gasbuggy site. However, based on available data, it will take 5900 years for the groundwater at the Gasbuggy site to flow to this point. Within 309 years tritium will decay below the appripriate concentration guide (CG) for the general public. Strontium-90 and cesium-127 will migrate no farther from the cavity than 320 meters and 3.5 meters, respectively, in 1000 years, and by this time both nuclides will have decayed to well below the CG. DETERMINATION OF THE FEASIBILITY OF REMOVAL OF ALGAL NUTRIENTS IN LAKE WATER BY ION EXCHANGE,
Massachusetts Univ., Amherst. Water Resources Research.
O. T. Zajicek.
Available from the National Technical Information Service as PB-199 914, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Publication No 12 (undated). 64 p, 13 fig, 14 tab, 45 ref. OWRR Project A-018-MASS (2).

Descriptors: *Eutrophication, *Ion exchange, *Phosphorus, *Theoretical analysis, *Anion exchange, Chlorides, Sulfates, Separation techniques, Lakes, Nutrients, Reservoirs, Resins, Phosphates, Fresh water.
Identifiers: Phosphate removal, Valency.

Excessive amounts of phosphorus, introduced by the activities of man, contribute to the accelerated

eutrophication experienced in many of our natural waters. The feasibility was studied of using ion exchange techniques, perhaps in a new way, to effect a reduction in the phosphorus levels of natural waters. A study of the ion exchange characteristics of phosphate species in the presence of chloride as a competing ion was completed. A similar study using sulfate as the competing ion is nearing completion at the present time and is briefly discussed. Over the pH range of natural waters, the phosphate species undergoing exchange is HPO sub 4 2-. With chloride as the competing ion the electroselectivity principle applies; with sulfate a similar phenomenon occurs due to the base strength of the HPO sub 4 2- ion. Kinetic studies of the exchange process indicate that it is the HPO sub 4 2- ion concentration which is rate controlling and this ion migrates through the resin-solution interface. Ion exchange removal of phosphate from natural waters is feasible and should be investigated further with field studies. (Wilde-Wisconsin)

stuary is a border between land and sea.
rine waters are the life-line of the sea, com-
prising a great natural resource. They have the one common characteristic, change. While little is ever lost in dynamic, natural change, great concern should be shown for the permanent change which man is causing in estuaries. A history is given of a century of wetlands exploitation, with new threats from pesticide and oil pollution. The first great need in combating estuary deterioration is research, so that the value of estuaries can be realized. The Massachusetts 'Squaw's Hole Case,' 426 river basin studies, and Florida conservation programs are presented as examples of efforts to protect and save marshes and estuaries. Above all else, remaining estuarine areas must be left in their natural condition. (McEntyre-PAI)

CONVENTION ON OIL POLLUTION AMENDED,
Shell International Marine Ltd., London (England).
M. P. Holdsworth.
Marine Pollution Bulletin, Vol 1 (NS), No 11, p 168-69, Nov 1970.

Descriptors: *Oil wastes, *Water pollution control, *Oil industry, *Legislation, Ships, Regulation, Control systems, Monitoring.
Identifiers: *IMCO, *Amendments, International Convention on Oil Pollution.

Amendments proposed to the Convention at the IMCO Assembly in October, 1969, are analyzed with respect to oil pollution control. Present provisions have not been effective for the following reasons: the limitation of effluent oil content by volume ratio is not necessarily relevant; enforcement has been impossible; and the 100 miles no-discharge zone is little protection against the waxy tank washing residues. The new amendments provide total prohibition of tank washing residue dumping, permits a tanker more than 50 miles offshore to discharge oil effluent if the oil instantaneous rate doesn't exceed 60 l. per mile of ship travel, and enables enforcement whereby a tanker which has cleaned on passage must arrive with full complement of residues. Additional new rules are discussed, including reasons for the deletion of existing Article III (c) which prohibited oil discharge from new tankers in excess of 20,000 gross tons. (McEntyre-PAI)

CRITICAL VIEW OF 1969 AMENDMENTS,
Nordic Union on Oil Pollution, Stockholm (Sweden).
G. Boos.
Marine Pollution Bulletin, Vol 1 (NS), No 11, p 169-170, Nov 1970.

Descriptors: *Oil wastes, *Legislation, *Water pollution control, *Oil industry, Ships, Control systems, Monitoring, Regulation.
Identifiers: *IMCO, *Amendments, *Critical review, International Convention on Oil Pollution.

1961 Amendments adopted by the sixth IMCO Assembly restrict oil discharge from ships considerable more than previously. The impact for oil tankers is that the load-on-top system will be compulsory whereby oil discharge into the sea from tank washings and the ballast water is avoided. A small discharge will still be allowed on the way to the loading port not nearer than 50 miles to land and only with certain precautions. Drawbacks of the various amendments are examined, showing that there will still be permitted a large amount of oil discharge and of such nature that it will persist until it reaches shore. A serious retrogression is the abandonment of the present requirement of total oil discharge prohibition for new ships of 20,000 tons gross or more. The ultimate goal of total oil discharge prohibition has once again been put off for a future time. (McEntyre-PAI)

OIL POLLUTION DEFENSE SYSTEM.
Harding Pollution Control Corp., West Hempstead, N.Y.

Undated. 15 p, 5 fig.

Descriptors: *Gulf of Mexico, *Oil wastes, *Water pollution treatment, *Water pollution control, Equipment, Oil industry, Pollution abatement.
Identifiers: *Pollution defense stations, *Oil containment, *Oil recovery, Oilevator.

The Harding Oil Pollution Defense System, a system for the containment and recovery of oil spills, is presented. Containment procedures are explained and illustrated whereby encirclement of the oil spillage is accomplished by means of a vertical barrier called the Bennett Oil Containment Boom. The recovery of the spilled oil is accomplished by the Oilevator, which 'laps up' the oil by a conveyor belt, leaving behind the sea water. Additional information includes Oilevator specifications and illustration, and independent test reports from Shell Pipeline Company and Imperial Oil Enterprises Limited. The Gulf Coast Plan would establish five Pollution Defense Stations along the Gulf Coast. The stations would be equipped with the Bennett offshore boom and up to 5 Oilevators, and staffed with standby crews. The economics of such a program is explained and a price schedule included. MARINE POLLUTION AND FISHERIES,
Peter Hjul, and David Glen.
A special report on the FAO Technical Conference in Rome, December 1970. Fishing News International, Vol. 10, No. 2, p 12-22, February, 1971.

Descriptors: *United Nations, *Water pollution control, *Water pollution sources, *Water pollution effects, Water law, Monitoring, Control systems.
Identifiers: *FAO conference, Marine pollution, International cooperation.

A summary report is given of the FAO Technical Conference on Marine Pollution and its Effects on Living Resources and Fishing, held December 9 - 18, 1970, in Rome, with 415 delegates attending from over 40 countries and a dozen international organizations. The overall consensus was that marine pollution, while becoming increasingly serious, can still be controlled and abated through scientific endeavor and a global system of monitoring. Topics covered were offshore dumping, mercury poisoning, oil pollution, shellfish vulnerability, industrial pollutants, metal compounds, pesticide pollution, pollution of coral reefs, effects on ecosystems, role of population in pollution, international controls, fishing bans, and an effective global pollution monitoring system. AFTERMATH OF CALIFORNIA SPILL LINGERS,
Bill Rintoul.
Offshore, Vol. 31, No. 4, p 52-53, April, 1971.

Descriptors: *Oil wastes, *Ships, *Legislation, *California, Shore birds, Water pollution control, Legal aspects.
Identifiers: *Oil spill, *San Francisco Bay, *Oil tanker collision.

The collision of two Standard Oil Company tankers beneath San Francisco's Golden Gate Bridge in January 1971, and the resultant 20,000 bbls oil spillage into San Francisco Bay, are described. Cleanup efforts of Standard Oil were commended, with about two thirds of the spillage recovered. Property owners and boat owners brought three class-action lawsuits amounting to billions of dollars in damage against the company. The proposed Congressional port and harbor safety bill, and the bridge-to-bridge communications bill are

discussed. The first bill would strengthen Coast Guard powers to regulate harbor area traffic, including mandatory manning of ship-shore radio circuits. The second bill would require all ships in and around harbors to maintain voice communications by bridge-to-bridge radiotelephone. An examination of how the collision occurred was aided by a sequence of radar pips taken by a Coast Guard automatic camera. Special efforts were made at the bird-cleaning and recovery centers of the San Francisco Zoo and the University of California Services Center to save oil-soaked sea birds, but survival rates were low. ECONOMICS OF WATER QUALITY CONTROL MEASURES,
Idaho Univ., Moscow. Water Resources Research Inst.
E. L. Michalson.
Speech at Annual Meeting of Soil Conservation Society of America, Boise, Idaho, Nov 21-22, 1969. 12 p, 1 fig.

Descriptors: *Water quality control, *Economics, *Waste water treatment, Pollution abatement, Idaho, *Planning, Water resources development, Evaluation, Water pollution control.
Identifiers: Environmental quality.

A basin wide water quality control program in Idaho is investigated. Water quality problems in Idaho include agricultural (chemical and animal), municipal (water supply and waste disposal), and industrial (discharge and thermal pollution). Water has two particular characteristics affecting quality control: it has an ability to renew itself, and it has a natural ability to oxidize and stabilize organic wastes on a continuous basis. When the waste load of a stream is too great for the stream to assimilate, there are four alternative methods available to control water pollution: (a) low flow augmentation, (b) prevention, (c) treatment, (d) recycling of effluents. In an economic sense there are two characteristics of water quality that create problems: (1) variability of the water supplies, (2) differentiation of demand for water of various qualities according to uses. Another problem is that benefits are difficult to identify and almost impossible to quantify. For these reasons the major economic interests revolve around the costs of control measures. Costs to society and the industrial polluter need to be determined. Some form of governmental coordination on water quality at the federal level is necessary to insure standards. When the problem of water quality control is adequately defined, then engineers, economists and other research workers can formulate optimal plans. (ray-Chicago)

REVIVING THE GREAT LAKES,
Chicago Univ., Ill. Center for Urban Studies.
John R. Sheaffer.
Saturday Review, p 62-65, Nov 7, 1970. 2 figures.

Descriptors: *Waste water disposal, Area redevelopment, *Water pollution control, *Irrigation water, Crop production, Michigan, Irrigation.
Identifiers: *Muskegon County (Mich).

This article describes the plans for the initiaton of a large-scale water pollution control project on the eastern shore of Lake Michigan in Muskegan County. Using the approach of a 'closed ecological system,' the project will clean up the lake by diverting sewage away from the lake and into production as irrigation water. Although the author explains that the original cost of the project is more than alternative short term treatment plant proposals, the economic potential of the project is enormous. Not only will the newly irrigated lands be able to provide profitable corn production, the employment and recreational possibilities will be expanded as well in the area. (Holmes-Rutgers)

ORSANCO: PIONEER WITH A NEW MISSION,
Peter J. Piecuch.
Environmental Science and Technology, Vol 5, No 1, p 22-23, Jan 1971. 1 fig.

Descriptors: *Water quality control, *Regions, Political aspects, *Water pollution control, Ohio.
Identifiers: *Ohio River, Ohio River Valley Water Sanitation Commission (ORSANCO).

This article describes the regional approach to water pollution control regulation carried out by the Ohio River Valley Water Sanitation Commission during its twenty-two year history. Although ORSANCO, as the commission is referred to, is not a treatment authority, it has been instrumental in monitoring the water quality of the Ohio River and in enforcing the Federal government's and its own water quality standards. The author underlines the importance of the regional in contrast to the federal approach to water pollution control enforcement. (Holmes - Rutgers)

WEEPING LOVEGRASS FOR VEGETATING STRIP-MINE SPOILS IN APPALACHIA,
Northeastern Forest Experiment Station, Berea, Ky.
Willis G. Vogel.
In: Proc First Weeping Lovegrass Symposium, The Samuel Roberts Noble Foundation, Ardmore, Oklahoma, p 152-162, Apr 28-29, 1970.

Descriptors: *Strip mines, *Vegetation establishment, *Cover crops, *Appalachian mountain region, Spoil banks, Grasses, Legumes, Forage mixtures, Hydrogen-ion concentration, Revegetation, Nutrient requirements, Black locust trees, Reclamation, Kentucky.
Identifiers: *Weeping lovegrass, *Strip-mine reclamation, Cover crops.

Weeping lovegrass is useful for vegetating strip-mine spoils in Appalachia because it produces quick cover on a wide range of spoil conditions. It is more tolerant of extremely acid spoils (pH 4.0-4.5) and of dry sites and summer growing conditions than most of the commonly used cool-season grasses and legumes. Although relatively short-lived, it works well in mixtures with slower-developing, long-lived grasses and legumes. It provides the desired quick cover during the first growing season but does not crowd out the companion species, which usually obtain dominance by the third growing season. When sown with direct-seeded black locust, lovegrass is less competiti with the locust seedlings than are the oft-used co season grasses. Nitrogen and phosphorus fertiliz are needed for establishing quick cover of lovegr on many Appalachian coal-mine spoils. (Vog USFS)

Identifiers: *Ogallala aquifer (Texas).

A digital simulation model constructed by the California Department of Water Resources for application in the Riverside-Chino Basin area of Los Angeles County was adapted to a portion of the Southern High Plains of Texas. The portion of the High Plains Underground Water Conservation District Number 1 lying within Potter, Randall, Deaf Smith, Parmer, Castro, Bailey, and Lamb Counties was selected for use in this study. Total area is 3,182.4 square miles. The study area was later reduced to a portion of the original study area lying in Parmer, Lamb, Castro, and Bailey Counties, an area of 2,288.6 square miles. The model should have substantial value to management as a decision making tool, but application is badly handicapped at the present by lack of high quality input data. Identifiers: *Ogallala aquifer (Texas).

The magnitude of the economic dependence upon the Ogallala aquifer has established a trend to its depletion, and as the water table draws closer to the base of the aquifer, the configuration of the aquifer is undergoing change. Therefore, to economically model this aquifer to a nearly depleted condition requires a dynamic model that can effect its own internal adjustment to compensate for the changes in aquifer configuration. WATER RESOURCE SYSTEM OPTIMIZATION BY GEOMETRIC PROGRAMMING,
Texas A and M Univ., College Station.
W. L. Meier, Jr., C. S. Shih, and Duane J. Wray.
Available from the National Technical Information Service as PB-199 645, $3.00 in paper copy, $0.95 in microfiche. Water Resources Institute, Technical Report No. 34, Feb 1971, 117 p, 6 fig, 1 tab, 60 ref, 2 append. OWRR Project A-011-TEX (4).

Descriptors: *Optimization, *Optimum development plans, Planning, Design, *Dynamic programming, Linear programming, Water utilization, Costs, *Cost analysis, Filtration, Water purification, Waste water treatment, Model studies, *Computer models.
Identifiers: *Geometric programming, Cost models, *Filtration systems, Computer algorithms.

The aim of this research was to study the applicability and usefullness of geometric programming in water resource planning and design activities. To study the use of geometric programming in practical problem solving, a computer algorithm was developed. A variety of water resources problems were solved using the algorithm. There is a significant need for techniques which will permit design and operation of either proposed or existing water filtration systems. Because the cost models and constraints for water filtration design problems are generalized polynomials, geometric programming would be a good optimization technique to use. Because water filtration problems have not been the subject of optimization analyses in the past to any significant degree, some time was spent in developing cost models and formulating the problem. This effort and the optimization analysis combining linear and geometric programming is described extensively in the report. The report includes a tutorial explanation of geometric programming, a description of the computer algorithm used, the description of the water filtration cost model, and an explanation of the use of geometric programming in an application.

1970. 11 p, 4 ref. OWRR Project B-007-ARIZ (7).

Descriptors: *Evaluation, *Value, *Decision making, *Systems analysis, *Investment, Hydrologic data, Costs, Limiting factors, Analysis, Bridge design, Optimum development plans, Computer programs, Computer models.
Identifiers: *Decision theory, *Uncertainty, *Utility function, *Goal selection, *Bayes risk, Expected variable cost, Opportunity loss, Search routine, Integration, Objective function, Error levels, Rillito Creek (Tucson-Ariz).

Decision processes involve uncertainty which is reduced with information. Because perfect hydrologic knowledge requires highly excessive investment, this paper delineates a method which evaluates uncertainty in hydrologic decision making. The report compares uncertainty to cost, and provides a basis for deciding when additional data is economically excessive. Decision definition, goal selection (utility function), decision making and uncertainity analysis are outlined. An imaginatively treated example of deciding on the depth of bridge piles for Rillito Creed, Tucson, Arizona, is developed in terms of Bayes risk (expected variable cost) and opportunity loss. Programming methodology includes search routine, one- and two-dimensional integration, and objective function. Error levels and limits of integration are evaluated. The computer program took 235 seconds. It indicated that a Bayes risk of $7,479, expected opportunity loss of $2,930, expected opportunity loss of $2756 for an additional year's data beyond 1950 to 1960 record, produced a minimized depth of 16.1 feet. There was a $90 Bayes risk variation from 15 to 17 feet. The object was to minimize the Bayes risk for a given pile depth. (Popkin-Arizona)

DISCRETE DIFFERENTIAL DYNAMIC PROGRAMMING APPROACH TO WATER RESOURCES SYSTEMS OPTIMIZATION,
Illinois Univ., Urbana.
Manoutchehr Heidari, Ven Te Chow, Petar V. Kokotovic, and Dale D. Meredith.
Water Resources Research, Vol 7, No 2, p 273-282, Apr 1971. 10 p, 8 fig, 2 tab, 15 ref. OWRR Project B-030-ILL (5).

Descriptors: *Optimization, *Dynamic programming, *Water resources development, Linear programming, Time, Operations, Digital computers.
Identifiers: *Iterative technique, Recursive equation, Trajectories, Invertible systems, Memory requirements.

An iterative method that could ease the difficulties of memory requirements and computer time requirements for the optimization of operating policies of multiple unit and multiple purpose water resources systems by traditional dynamic programming with the use of high speed digital computers was presented. The discrete differential dynamic programming (DDDP) approach was an iterative technique in which Bellman's recursive equation of dynamic programming was used to search for an improved trajectory among the discrete states in the neighborhood of a trial trajectory. The method was used for an invertible, multiple dimensional system and the procedure accuracy and speed was much greater than the accuracy and speed of an interpolation procedure. A simplified system, which was formulated and solved by Laison by linear programming and succesive approximation dynamic programming, was solved by means of the proposed approach. The operating policy of the four-dimensional reservoir network was optimized over 12 operating periods and was used as an illustrative example. By limiting optimization to a few lattice points around a trial trajectory, the memory requirement was curbed substantially and computer time was reduced since fewer tests had to be made per state of each stage. PROBABILITY THEORY AS AN AID TO RESEARCH PLANNING,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
Paul M. Berthouex.
Journal American Water Works Association, Vol 61, No 2, p 652-658, 1970. 6 fig, 4 tab, 9 ref.

Descriptors: *Decision making, *Economic prediction, *Pilot plants, *Cost-benefit ratio, Probability, Analytical techniques, Planning, Design data, Model studies, Research and development, Network design.
Identifiers: *Probability theory, Utility theory.

The theory of probability has been used to evaluate the problem of iron removal by oxidation and rapid sand filtration. The efficiency and cost of different treatments are estimated on the basis of simple probability equations for independent, mutually exclusive, and not mutually exclusive events or components. A network diagram and tables provide illustrations of the probability analysis for all possible outcomes. Because the probabilities are assigned subjectively, the suggested approach requires a partnership between the theory and personal judgment. (Wilde-Wisconsin)

Identifiers: *Keystone Reservoir (Okla), *Oxygen depletion.

Keystone Reservoir on the Arkansas River (Oklahoma) is fed by two chief tributaries, the Arkansas River of good quality water and the Cimarron River, containing natural brine and four times the dissolved solids of the Arkansas River, thus establishing a deep density current. Because the reservoir shoreline is rapidly becoming urban, natural and cultural eutrophication is anticipated. The long-term objective is to establish a chemical-physical-mathematical model to improve understanding of ecoregulating parameters to serve as a base for comparative studies of other impoundments and give insight into problems of water quality management. Based on the premise that a lake is eutrophic when any portion becomes anaerobic, mathematical simulation models were designed choosing dissolved oxygen concentration as the dependent variable. Mathematical model configurations are described, including linear (along reservoir bottom), depth axis, 10-mesh triangular matrix, 6x18 triangular matrix, time-dependent linear, and branched 10-compartment model; the latter appears the most powerful tool in reservoir ecosystem modeling--not only can the input and output fluxes of any given constituent be monitored at each compartment in the reservoir network, but the effect of each flow rate and chemical reaction rate on the critical fluxes and concentrations can be readily followed and interpreted. nomics involves human goals, both market and -market, and economists are not merely ac- ntants, but social scientists. Multiple use urce management is a question of economic leoffs and therefore deserves discursive nomic analysis. Cost-benefit analysis usually e for large reservoir and reclamation projects deficient because market value methodology is ting, secondary negative effects and marginal lyses are not considered, and detailed cost and efit information are developed for only one al- ative. Using these factors with optimum duct mix considerations, the author attempted a t-benefit analysis model for multiple use natural urce planning in the Salt-Verde Basin, Arizona. objectives were: (1) An analysis of alternate ershed management programs in the area, con- ring all known products, alternative treatments alternative input quantities in order to find an imal combination, (2) Assessment of alternative gram impacts on national, regional and local nomic areas. Pert diagrams for data collection processing are outlined and a linear program del was constructed, which shows how various binations of treatments effect differing out- s. Data collection methods in the National est are described. Coefficients for inputs, out- s and treatments were developed and a sensitivi- nalysis was utilized to determine their effect on outcome of the model. Data collection is the t costly part of the entire procedure. The model apable of evaluating both non-market and mar- factors. Model applications to a chaparral area, n 4 alternatives, are described. E CALIFORNIA WATER PLAN,
ghborough Univ. of Technology (England).
nard M. Cantor.
rnal of Geography, Vol 68, No 6, p 336-371, t 1969.

criptors: *Inter-basin transfers, *California, ater storage, *Dams, *Planning, Conveyance ctures, Central Valley Project, Irrigation dis- ts, Drainage systems, Arid lands, Pumping its.

California Water Plan has been devised to sport water from its origin in the northern part he state to the southern part where the highest centration of population and the greatest need irrigation and industrial development exist. ious components dams, aqueducts, pumping stations, and reservoirs - have already been completed, and others are under construction or in the planning stages. Criticism has developed focussing on inadequate drainage systems, increasing salinization, and skyrocketing costs. It is suggested that by the time the project is completed in 1980 desalination of seawater will be competitive in cost, and could have avoided the detrimental environmental effects of the present plan. NEGLECTED RESOURCE,
Moscow State Univ. (USSR). Dept. of Soil Science.
V. A. Kovda.
Presented at an international conference 'Arid Lands in a Changing World,' Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 473-479, 1970. 1 ref.

Descriptors: *Arid lands, *Water supply, *United Nations, *Irrigation practices, *Productivity, Water resources development, Social aspects, Organizations, Investment, Natural resources, Scientific personnel.
Identifiers: *Agrarian reform, *Developing countries, *Green revolution, *Development obstacles.

If one compares the speed of change in different geographic areas of the world, the arid areas suffer by the comparison. The time has therefore come to reevaluate traditional approaches to the problem of aridity. The problem of water supplies has been somewhat alleviated by great advances in groundwater exploration and advances in desalination combined with contemplated interbasin transfers should eventually have great impact on arid areas. The green revolution has led to great crop production increases but the picture is mixed. Dryland farming productivity remains low, irrigation efficiency is low and salinity problems are increasing in irrigated areas. Many international organizations are helping, but the basic fact of 5-10 cents per capita investment in arid-zone science as compared with 2-7 dollars per capita in developed countries shows that international organizations can at best play only a catalytic role in development in underdeveloped countries. There are 4 major obstacles to future progress: (1) Low industrial potential, which is the crucial obstacle; (2) Agrarian reform, which would provide incentives to the population; (3) The great need for natural resource surveys; (4) The outmigration of native scientists to the developed countries. (Casey-Arizona)

UNRESOLVED ISSUES,
Chicago Univ., Ill. Dept. of Geography.
Gilbert F. White.
Presented at an international conference, 'Arid Lands in a Changing World,' Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90 , AAS, p 481-491, 1970.

Descriptors: *Arid lands, *Social aspects, *Water resources, *Education, *Economic feasibility, Irrigation practices, Ecology, Natural resources.
Identifiers: *Population pressures, *Underdeveloped countries.

This was the final paper presented at the international symposium, and the author summarizes the differences in problem perception between this symposium and a similar symposium on arid lands 14 years ago. The major difference is the shift in emphasis away from purely technological concerns with water development and agriculture toward the increasing realization that social problems are critical in resource development. Major social problems revolve around the grim fact of overpopulation combined with massive migrations from rural regions to urban areas, thus depriving rural regions of important segments of their population. Also, it is being learned that investments in education pay much higher returns than investments in structures. There have been many important advances in arid regions such as a rising tendency to look for multiple solutions to resource problems, heightened attention to the ecological impacts of man's activities and increased scientific information flow. Nevertheless, the disparities in income between rich and poor countries are growing. Five major unresolved issues emerged at the symposium: (1) the importance of irrigation; (2) expansion vs. intensification of new development; (3) the value of single large projects compared to several small projects; (4) the role of amenities; (5) research in basic relationships vs. problem-solving. The coastal deserts of Chile and Peru, the Atacama Desert of Chile, the Monte and Patagonian Deserts of Argentina and small regions of Brazilian northeast and coastal Venezuela constitute the major desert regions of South America. The great coastal desert and its interior region, the Atacama, are caused by the interacting effects of the South Pacific Anticyclone, the cold Peruvian Current and the limiting barrier of the Andean Cordillera. The coastal desert experiences fog and temperature constancy, both of which are absent from the Atacama. The mineral soil and offshore resources of these 2 deserts are described. The historical development of irrigation agriculture in the Peruvian Desert is reviewed and compared with modern agriculture in the area, where there are a large number of small rivers. The growing of rice in the Peruvian Desert resulting in drainage and salinity problems is an example illustrating the problem of introducing crops from humid areas into arid regions, resulting in poor use of limited water resources. Another problem is the building of large cities, such as Lima, on fertile valley soils. The natural regions of these deserts are described and needed research proposed. Actual and potential water resources are also considered in detail. The author feels that a new water law is needed in Peru, where agrarian reform signifies a rational redistribution of irrigation water rights. (Casey-Arizona)

PUBLIC ACTION: REQUISITE FOR SUCCESS,
William E. Warne.
Presented at an international conference, 'Arid Lands in a Changing World', Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 411-420, 1970. 8 ref.

Descriptors: *Irrigation districts, *Water contracts, *Social aspects, *Arid lands, *Planning, California, Legal aspects, Economic efficiencies, Education, History, Water permits, Foreign lands, Water policy, Water users, Public benefits, Governments, Organization.
Identifiers: *Iran, *California State Water Project, *Dez Irrigation Project.

A crucial part of world food supplies are grown on irrigated lands, particularly in arid and semiarid regions. The production of such regions must be doubled, through creation of new water projects, by the year 2000. The construction of a water project involves physical and engineering problems in the planning and building of appropriate structures. Its efficient utilization involves the creation of appropriate social and legal institutions, such as irrigation districts. The author maintains that the latter is too often neglected. The collapse of irrigation agriculture in ancient Mesopotamia and the difficulties of initiating water projects in 19th century California are cited as consequences of collapsing or badly-developed water institutions. By contrast, the successes of the California State Water Plan and the Dez Irrigation Project in Iran are described in detail to illustrate the importance of such institutions. Governmental stability, social innovation and user involvement are all vital ingredients in the creation of water project institutions. (Casey-Arizona)

HYDROLOGICAL RESEARCH IN SOUTH AFRICA,
University of the Witwaterstrand, Johannesburg (South Africa). Dept. of Civil Engineering.
D. C. Midgley.
South African Journal of Science, Vol 66, No 12, p 380-391, Dec 1970. 58 ref.

Descriptors: *Hydrology, *Surface waters, *Groundwater, *Research and development, *Data collections, Floods, Droughts, Water resources, Evaporation, Silt, Streamflow forecasting, Rainfall.
Identifiers: *South Africa.

In the past, practically throughout the entire subcontinent of southern Africa, hydrological research efforts have concentrated mainly on ad hoc problems within state organizations. More recently there has been an upsurge of interest in several state universities and among consulting civil engineers. Engineering problems associated with surface waters involve either too little or too much water. The research problems, measurement techniques, and accumulated data in South Africa are reviewed for streamflow, rainfall, flood studies, droughts, water resource surveys, evaporation and river silt loads. It appears that the combination of erratic rainfall, erratic river flow, high evaporation and heavy siltation calls for an enlightened philosophy of water resources development in the subcontinent. In view of the great reliance on groundwater in many areas there is surprisingly little research in groundwater hydrology. The greatest advances in data accumulation are likely to result from broad-scale coordination of information from scattered areas rather than from reliance on a few localized large hydrological research stations. (Casey-Arizona)

THE LITANI RIVER OF LEBANON: AN EXAMPLE OF MIDDLE EASTERN WATER DEVELOPMENT,
Morgan State Coll., Baltimore, Md. Dept. of Geography.
James Hudson.
Middle East Journal, Vol 25, No 1, p 1-14, Winter 1971. 1 fig, 23 ref.

Descriptors: *Water resources development, *Arid lands, *Consumptive use, *Water allocation (Policy), *Cost-benefit analysis, Irrigation, Hydroelectric power, Thermal power, Urbanization, Water costs, Precipitation (Atmospheric), Evapotranspiration, Political aspects, Social aspects, Runoff, Economic feasibility.
Identifiers: *Lebanon, *Middle East, *US Bureau of Reclamation.

Problems in the water resource development of the Litani Basin of Lebanon are typical of those in many similar basins of the arid Middle East. The major source of basin water is precipitation in nearby mountains, which is variable in time and amount. Over half is lost by evaporation and transpiration while the rest either appears as runoff or moves through groundwater channels to reach the river via springs. In the Basin as a whole, average annual flow is 700 million cubic meters. Flow variation is less marked than precipitation seasonality would suggest. The primarily urban uses of water (hydroelectricity, municipalities, industry and thermal cooling) are less consumptive than irrigation, thereby allowing for much greater reuse efficiency. This was made plain in a U.S. Bureau of Reclamation economic analysis in its plan for the Litani, which estimated the lower annual income and higher operating costs of an irrigation scheme as opposed to a hydroelectric scheme. When the Litani project was built, irrigation and municipal uses were deferred and so far only hydroelectric power has been produced. Although pressures are developing for irrigation water, the government has so far resisted them. This illustrates the problem of priorities in water development and the probable fallacies of the dream of Making the Desert Bloom. (Casey-Arizona)

THE SOIL AND WATER RESOURCES OF THE LOWER INDUS REGION
Sind Univ., Hyderabad (Pakistan). Dept. of Geography.
M. M. Memon.
Oriental Geographer, Vol. 13, No. 1, p. 41-54, Jan 1969. 3 fig, 5 tab, 12 ref.

Descriptors: *River basins, *Surface waters, *Groundwater, *Irrigation efficiency, *Water requirements, Water conservation, Aquifers, Soil types, Saline soils, Evapotranspiration, Water resources, Crop response, Productivity, Arid lands, Irrigation practices.
Identifiers: *West Pakistan, *Indus River, *Waterlogging.

Although the economy of West Pakistan is dominated by agriculture, irrigated crop yields are very poor and production/acre and production/capita steadily declined in the 1955-65 decade. This is particularly serious in view of the 2.38 percent/year population increase rate. Because the region is hot and arid, high evaporative demand requires an irrigation depth of 3.5 feet. Therefore, although about 13 million acres are available for cultivation, current water resources dictate a restriction to 7-8 million acres. Although the alluvial soils of the region are fertile, faulty irrigation and agricultural practices have resulted in water wastage, soil deterioration and aggravation of salinity and waterlogging problems. It is recommended that the poorer soils be withdrawn from production and surface and groundwater supplies be further developed and allocated only to the areas with the best soils, thereby allowing intensive cropping, increased use of fertilizers and other imputs. ENGINEERING - THE CHALLENGE OF
OURCE DEVELOPMENT,
rnia Dept. of Fish and Game, Stockton.
E. Skinner.
Resources Bulletin, Vol 7, No 2, pp 355-
April 1971.

iptors: *Environment, *Resource Develop-
*Ecology, Conservation, Aesthetics, Safety
s.
fiers: *Eco-engineering, Quality of life,
vable resources, Regulatory agencies.

It is presumed that the present environmental thrust is not a wholly transitory fad; that there will be a residual impact on American society which will demand greater consideration in the future of ecological and environmental values by resource developers and public works agencies. An example is cited to show the validity of the environmental thrust and the severe consequences of ignoring it under the present emphasis on this aspect of resource development. An attempt is made to understand some of the reasons for the dramatic change in public attitude toward the environment and opposition to projects of apparent benefit to society. It is suggested that basic changes in philosophy and concept will be necessary in the field of resource development. Some broad ecological and developmental guidelines are provided in the interest of implementing environmental considerations. Finally, those involved in resource development and public works are challenged to accept the concept of eco-engineering; a concept combining the competing elements of resource development and conservation. PROJECT 2000, A PLANNING IMPERATIVE,
Bureau of Outdoor Recreation, Washington, D.C.
Herbert M. Runkle, and Thomas H. Perkins.
Water Resources Bulletin, Vol 7, No 2, pp 348-354, April 1971.

Descriptors: *Planning, *Social change, *Decision making, *Social aspects.
Identifiers: *Social planning, Water Resources Planning.

Wider social planning is badly needed for the prolonged survival of man on the earth. Reasonableness requires blending of planning and construction--but a sharp line of independence is essential. Through intensive professional development and achievement of professional expertise, many outstanding technicians often move into vital decision making positions within their respective agencies. As planners, they see part of the action but miss the big picture. Problem solutions become restricted to agency or individual authorities and are not always the best alternatives. Thus, the planning field is overflowing with solutions to our every problem, but the solutions themselves often carry their own problems. (Wray-Chicago)

ARE SHORT-TERM ENVIRONMENTAL ACTION PROGRAMS POSSIBLE--THE INLAND LAKE PROJECT EXPERIENCE,
Wisconsin Univ., Madison. Water Resources Center.
Stephen M. Born.
Water Resources Bulletin, Vol 7, No 2, p 252-259, Apr 1971.

Descriptors: *Environment, *Eutrophication, *Lakes, Lake shores, Resource development.
Identifiers: *Upper Great Lakes Region, Inland Lake Demonstration Project, Snake Lake, Horseshoe Lake, Environmental problems.

A clear trend in recent years has been the increased public awareness of environmental deterioration and pollution. Society appears willing to support long-range fundamental research in environmental areas (such as eutrophication research) as long as action programs (such as lake renewal) are undertaken too. The experiences of the Inland Lake Demonstration Project afford an opportunity to evaluate one kind of short-term action-oriented response. The broad objectives of the Project have been the demonstration of techniques to restore, maintain, and protect a high quality environment in lakes and on shorelands within the Upper Great Lakes Region. Snake and Horseshoe Lakes were sites chosen for lake renewal activities. The most difficult problems of trying to execute short-term environmental programs is the frequent inadequacy of scientific knowledge to guide problem definition, treatment selection, and prediction of results. WATER RESOURCES RESEARCH, A CHALLENGE TO THE SOCIAL SCIENTISTS,
Utah Water Research Lab., Logan.
Dean F. Peterson.
Utah Water Research Laboratory, Utah State University, Occasional Paper 2, Logan, Utah, June 1968. 8 p.

Descriptors: *Water resources development, *Social values, Decision making, *Planning.
Identifiers: *Social scientists.

This paper deals with the role of engineers and social scientists in developing effective water resources plans. New standards are needed for making decisions about water resources. Planning requires all kinds of scientists, including social scientists. Relative values must be placed on water resource goals: conservation, aesthetics, improved living standards, etc. Decision making also involves the participants, and reaching a consensus of the majority without sacrificing minority needs. Water is a major resource with which man is concerned, and its development, therefore, must have some significant relationship to human institutions and values. In addition, technological and economic factors must be considered. For effective planning a team approach, with technologists and social scientists, holds the best possibilities. (Wray-Chicago)

FEDERAL ROLE IN THE URBAN ENVIRONMENT,
Department of Housing and Urban Development, Washington, D.C.
Robert C. Wood.
Public Administration Review, Vol 28, No 4, p 341-347, Aug 1968.

Descriptors: *Environment, *Urban renewal, *Urbanization.
Identifiers: Metropolitan areas, Model cities.

This paper deals with how the government can cope with the expected urban growth in this country. Starting in the 1930's, pressure mounted for federal urban representation. It culminated in 1965 in the Department of Housing and Urban Development. Various aspects of the Department's work include: (1) private mortgage market, (2) central city problems, (3) metropolitan areas and urbanizing countryside, (4) model cities and developmental work in intergovernmental relations. In addition to these program groupings, three steps were taken to assure a more effective Department: (a) consolidation of the Department's administrative function, (b) appointment of a deputy under secretary for policy analysis and program evaluation, (c) designation of a Budget Review Committee. With only a few years of operation, several trends are recognized--an integrated approach to urban problems, development of broader support bases, and strengthened legislative tools. It is hoped that with federal assistance in urban development new building techniques will emerge, land costs will be lowered, a wide range of housing designs will be provided, and new jobs will be created. (Wray-Chicago)

COMPLEMENTING OBJECTIVE PROCEDURES WITH SUBJECTIVE PRIORS IN WATER RESOURCES PLANNING,
Temple Univ., Philadelphia, Pa. Economic Research Service.
P. Thomas Cox, and Bernard Siskin.
Water Resources Bulletin, Vol 7, No 2, p 368-375, Apr 1971.

Descriptors: *Decision-making, *Planning, *Evaluation.
Identifiers: *Stepwise multiple discriminant analysis, Water resource project, Prior probabilities.

A procedure is outlined which allows consideration of both objective and subjective indicators to establish priorities in plan implementation of water resource development. The objective procedure utilizes stepwise multiple discriminant analysis to predict community performance regarding planned project implementation, based on previous project implementation in the Northeast. The subjective procedure incorporates prior probabilities developed by the planner, based on observation and experience gained through the planning process. The proposed analysis could eliminate waste through better allocation of planning funds to implementation studies exhibiting higher probability of early implementation. (Wray-Chicago)

ROCKY MOUNTAIN URBAN WATER GOALS,
American Society of Civil Engineers, New York. Urban Water Resources Research Program.
M. B. McPherson.
Journal of American Water Works Association, Vol 63, No 3, p 176-180, Mar 1971. OWRR Project C-1536 (No 1992) (6).

Descriptors: *Urban areas, *City planning, *Urbanization, Planning, Regions.
Identifiers: *Rocky Mountain, *Urban water resources, Metropolitan areas, Comprehensive management, Regional development.

The author has attempted to indicate that while eastward Rocky Mountain states have been heretofore relatively unaffected by the burgeoning urbanization taking place in much of the rest of the United States, there is a high probability that emerging national policy on urban dispersion may cause in-migration that will result in much greater urban populations in those states than suggested by projections based on past and present trends. Comprehensive management of urban water resources is inhibited by: the fractionalized character of local government in metropolitan areas; the incomplete resolution of national policies on urban growth, water quality, and environmental quality; the absence of adequate information and data for satisfactory analysis of the urban system; incomplete valuation methodologies for water-resource planning and development; and a confusion of federal agency metropolitan programs. Much can be learned from others sharing similar problems, and the 'information explosion' should not be deplored but aggressively exploited. (Wray-Chicago)

WATER RESOURCES DEVELOPMENT IN AN ENVIRONMENTALLY-CONSCIOUS ERA,
Sierra Club, Los Angeles, Calif. Angeles Chapter.
Alan Carlin.
Water Resources Bulletin, Vol 7, No 2, p 221-227, Apr 1971.

Descriptors: Environment, Economics, Taxes, Water rights, Inter-basin transfers, Conservation, *Water resources developments, *Evaluation.
Identifiers: *Environmental quality, Tax law, Sierra Club.

The Sierra Club has come to the conclusion in recent years that much more basic reforms are required in water resources development activities if the demands for environmental quality now evidenced by the American people are to be satisfied. Among the urgent reforms with indirect effects are those involving revision of the procedures used in evaluating proposed projects. These procedures should be revised so that future evaluations will much more accurately reflect the economic and environmental merits of proposed projects. Basic reforms of tax policies are also needed that will eliminate most of the private profit available to those who can persuade the government to increase the value of their land through the construction of water projects. Finally, some additional actions can be taken that will have a direct impact on lessening the adverse environmental impact of water projects beyond the provisions of the National Environmental Policy Act of 1969. PROCEEDINGS OF A CONFERENCE ON WATER RESOURCES PLANNING AND PUBLIC OPINION.
Nebraska Univ., Lincoln. Water Resources Research Inst.

Available from the National Technical Information Service as PB-199 916, $3.00 in paper copy, $0.95 in microfiche. Conference held Mar 8-9, 1971, edited by Warren Viessman, Jr, Apr 1971. 80 p. OWRR Project A-999NEB (3).

Descriptors: *Planning, Water resources development, *Decision-making, *Social aspects, Social values, Social participation, *Public policy, Psychological aspects.
Identifiers: *Public opinion, Public involvement, Environmental policy.

This conference was designed to acquaint water resources planners, managers, developers, researchers, and educators with public opinion. The conference dealt with such basic questions as: What is public opinion. How can planners assess it. In what ways can the planner take advantage of existing opinion. How can public opinion be shifted in favor of the planner's innovation. (See also W71-08812 thru W71-08814)

THE PUBLIC DECISION-MAKER AS REPRESENTATIVE AND SPECIALIST: AN EXPLORATION IN LOW SALIENCE POLITICS,
Florida State Univ., Tallahassee.
Norman Luttbeg.
In: Proceedings of a Conference on Water Resources Planning and Public Opinion, University of Nebraska, p 2-26, Mar 1971.

Descriptors: *Decision-making, *Public policy, *Social aspects, Social values, *Planning.
Identifiers: *Public opinion polls, *Public involvement.

This paper looks at the public opinion polls and society's attitudes and participation in government in order to suggest methods applicable to decision-makers in the area of water resource utilization. The most important element of information concerning public opinion is to identify those instances in which the public will permit a decision by professionals versus those in which they expect their elected representatives to be responsive to public opinion. Every effort to measure existent public opinion with survey research is recommended. Other ideas highlighted are that the public does not expect to be represented at all times; public policy need not always follow public opinion. Also, when seeking the adoption and public acceptance of water resource utilization proposals, the support of elected leaders is vital. (See also W71-08811) (Wray-Chicago)

SOCIO-ECONOMIC RESEARCH WITHIN PUBLIC LAW 88-379,
Office of Water Resources Research, Washington, D.C.
Garland H. Hershey.
In: Proceedings of a Conference on Water Resource Planning and Public Opinion, University of Nebraska, p 69-76, Mar 1971.

Descriptors: *Water resources development, *Planning, Decision-making, *Social aspects, Social values.
Identifiers: *Socio-economic research, *Public involvement, Interdisciplinary studies, Environmental policy.

This paper looks at the Water Resources Research Act of 1964 which created the Office of Water Resources Research. From its inception, the OWRR has been interested in carrying out socio-economic research in the water resources field. Top priority has been given to methodology and criteria for water resources planning. Interdisciplinary research is supported, especially that focusing on economic, political, social, legal, and organizational problems associated with the Nation's water future. Examples of some interdisciplinary projects and public opinion research are cited. Water resources research is continually interested in finding effective methods of involving an informed public in the decision-making process. (See also W71-08811) (Wray-Chicago)

CHANGING PUBLIC OPINION: PROBLEMS AND PROSPECTS,
Florida State Univ., Tallahassee.
Donald F. Smith.
In: Proceedings of a Conference on Water Resources Planning and Public Opinion, University of Nebraska, p 45-59, Mar 1971.

Descriptors: *Decision-making, *Social values, Social aspects, Psychological aspects, *Planning, Social participation.
Identifiers: *Public opinion, *Advertising, Mass media.

This paper deals with the success of advertising campaigns as a method of changing public opinion about governmental policy as it is applied to water resources development. It is suggested that many present advertisers were trained in the 1930-40-50's and utilize stimulus-reinforcement theories. The author's proposal is to consider any attempt to change public opinion as a diffusion process. A process in which a deliberate attempt is being made to diffuse throughout the public an acceptance of some new idea, proposal or practice. This concept views man as a creature that actively interacts with in-coming messages, selecting some, avoiding some, and modifying some. Second, this model views man in society as an intricate network of social relationships, many of which play a part in the process of framing and changing opinions. A basic result of research in this area has been the identification of a four-stage sequence through which individuals go as they come to accept something new. The first stage is awareness, second-interest, third-evaluation, and four-decision. Some conclusions are (1) mass media alone is insufficient to change public opinion, (2) detailed grass-roots organizations in which individuals meet face-to-face are important, (3) there is need to construct messages to fit compatibly with existing opinions, (4) use of differing media and messages is helpful, (5) starting early to inform is advantageous. THE EAST-WEST WATER CONTROVERSY—BOTH SIDES ARE PARTLY RIGHT,
Stanford Univ., Calif.
R. K. Linsley.
Journal of the Sanitary Engineering Division, Proceeding of ASCE, Vol 93, No SA4, p 49-62, Aug 1967.

Descriptors: *Water management, *Planning, *Water resources, Economics, Projects, Downstream, Flood control, Navigation, Irrigation, Costs, Oceans, Deserts, Efficiencies, Hydrology, Conservation, Water pollution control.
Identifiers: Urban water supply, Sub-marginal farming, *Rational basis, Comprehensive planning.

The purposes of this discussion was a concept shared mutually by both the East and the West that the other half of the country was not doing a very good job of water management. It pointed out that we should learn to deal with water development on a completely rational basis and that we lack a coherent and rational national water policy. S

the myths that surround the water problem was scussed. The most important myth that must be oken is that our major goal is the development of r water resources. There are many alternatives ailable to us. Instead of concentrating our search primarily on the structural features of draulic projects and on hydrology, we need to do me research in the area of conservation of water the urban environment or on improving efficien- of water use in agriculture. We need to face uarely the economics of cost-sharing and reim- rsement between federal and local government. /ang-Rutgers)

VENUES, RATES, AND ADVANCE ANNING,
ord, Burdick and Howson, Chicago, Ill.
. Howson.
rnal American Water Works Association, Vol No 2, p 153-161, Feb 1960. 4 fig, 3 ref.

criptors: *Revenues, *Rates, *Costs, Operation maintenance, Depreciation, Growth rates, ancing, Construction, Capital investment, Dept, nmissions, Water quality, *Planning, Iowa.
ntifiers: *Advance planning, *Water utilities, Moines, Capital requirements, Rate schedule, g-term bonds, Reproduction cost.

vance planning of a water utility facilitates the ncing of new construction from current enues and results in a material saving in the cost vater service. Public water supplies must con- e to grow, and the money necessary to finance growth must come from water revenue. The rates for water service should be set well in advance of their effective date and are intended to provide for the future. Future operation and maintenance costs vary greatly and must be considered in fixing future rates. In municipally owned utilities, estimates of the gross revenue requirement are based on: operation and maintenance costs, debt service on obligations outstanding and to be issued in the succeeding 3-5 years, a depreciation allowance, and estimated average annual capital additions for the next 5 years. The utilities could do well to finance construction with less borrowing, simply by more careful planning. (Wang-Rutgers)

6D. Water Demand

CHARACTERISTICS OF HOUSEHOLD WATER CONSUMPTION IN THREE NEW HAMPSHIRE COMMUNITIES,
New Hampshire Univ., Durham. Water Resources Research Center.
Richard A. Andrews, and Martha R. Hammond.
Available from the National Technical Information Service as PB-199 706, $3.00 in paper copy, $0.95 in microfiche. New Hampshire University Water Resources Research Center Research Report No 3, Dec 1970. 21 p, 9 tab, 8 ref. OWRR Project A-018-NH (1).

Descriptors: *Water utilization, *Domestic water, *New Hampshire, *Water users, Water demand, Water costs, Lawns, Utilities, Water management (Applied), Water requirements, Cities.
Identifiers: *Household water consumption.

Water use in 361 households in three communities in southeastern New Hampshire was studied to determine the quantity of water used, causes for variation in quantity, the factors affecting consumption, and the annual household expenditures for water. Water use per household ranged from 8,000 gallons per year to 383,000 gallons per year. The quantity of water used daily per capita ranged from 8 gallons to 263 gallons. Lawn watering was not a major use of water. Households use more water during summer than during winter. Waste water disposal systems (septic tank or community disposal systems) were not a significant determinant of water consumption. There is a fixed 'overhead' quantity of water used, with an incremental use for each additional person of about 30 gallons of water daily. The overhead and the increment are determined by the appliances and fixtures of the house. The influence of the number of persons in the household and the physical characteristics of homes were more useful statistical determinants of water consumption than the single determinant of house value. Household expenditures for water were found to be an insignificant item in family budgets. (Knapp-USGS)

WATER IN THE SERVICE OF MAN,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Civil Engineering.
D. C. Midgley.
South African Journal of Science, Vol 66, No 11, p 350-358, Nov 1970.

Descriptors: *Hydrological cycle, *Planning, *Consumptive use, *Water properties, *Water users, Water resources development, Irrigation, Cooling, Municipal water, Groundwater, Surface waters, Desalination, Arid lands, Water allocation (Policy), Water vapor, Multiple-purpose projects.
Identifiers: *South Africa.

Both groundwater and surface water are in limited supply in South Africa, and estimates of future use indicate the country is not far from full exploitation of current resources. The hydrological cycle is reviewed and it is shown that when water enters the vapor part of the cycle, it is 'lost' to man. Practically all uses of water entail some conversion to the vapor phase. It therefore follows that a fundamental precept of water planning philosophy in water-short countries should be that water must be diverted to as many uses as possible before being allocated to consumptive uses. This necessitates highly coordinated national multi-use planning. The traditional practice of industrial and power site locations near low cost water for consumptive use must be abandoned. Municipalities use 10-20% of their source water while irrigation and thermal cooling stations use 80-100%. All sectors should therefore be located and coordinated so that waters shared by them are utilized with optimal efficiency. In arid lands, value added from water consumption is 44-51 dollars/acre ft for irrigation, about 250 dollars for recreation and 3000-4000 dollars for industry. Irrigation development in such regions should be avoided, and industrial development encouraged. (Casey-Arizona)

ESTIMATED WATER USE IN NEVADA,
Geological Survey, Carson City, Nev.; and Nevada State Dept. of Conservation and Natural Resources, Carson City.
Thomas J. Smales, and J. R. Harrill.
Nevada Division of Water Resources Planning Report No 2, Jan 1971. 32 p, 6 photo, 16 tab.

Descriptors: *Water utilization, *Nevada, Consumptive use, Withdrawal, Groundwater, Surface waters, Municipal water, Domestic water, Irrigation water, Stock water, Water supply, Water resources development, Water management (Applied), Planning, Water demand.
Identifiers: Nevada, Water Plan.

Withdrawals of water in Nevada from wells, springs, streams and rivers have increased from about 4.1 million acre-feet in 1950 to about 4.6 million ac. ft. in 1969. Use of spring discharge dropped slightly during this period, mainly due to the effects of heavy pumping in Las Vegas and Pahrump Valleys. Stream and river diversions increased from about 3.9 million ac. ft. to about 4.0 million ac. ft., an increase of about 2 1/2 percent. Pumpage from wells has increased by more than ninefold - from 53,000 ac. ft. in 1950 to about 490,000 ac. ft. in 1969. Most future increases will probably be from pumping groundwater. Between 1965-69 annual withdrawals for irrigation increased by less than 1 percent and electric power generation by about 4 percent. By contrast, public supply withdrawal soared by about 45 percent, and self-supplied industrial use by about 25 percent. (Knapp-USGS)

6E. Water Law and Institutions

GUIDELINES--WATER QUALITY MANAGEMENT PLANNING.
Environmental Protection Agency, Washington, D.C. Water Quality Office.

Environmental Protection Agency, Water Quality Office, Wash, DC (Jan 1971). 30 p, 3 fig, 5 append.

Descriptors: *Water resources development, *Planning, *Grants, *Standards, Administrative agencies, Programs, Coordination, Economic efficiency, Management, Methodology, River basin development, Waste water treatment, Waste water

(Pollution), Construction costs, Financing, Treatment facilities, Sewage treatment, Long-term planning, short-term planning, Non-structural alternatives, Federal project policy, Federal government, State governments, Local governments, Legal aspects.
Identifiers: Administrative regulations.

During the preparation of unified planning requirements for the Environmental Protection Agency Waste Water Treatment Works Construction Grant Program and the Housing and Urban Development Water and Sewer Facilities Grant Program, these Preliminary Planning Guidelines provide the basic considerations to be addressed in meeting the requirements of both organizations. The guidelines, applicable to planning agencies concerned with development of water quality management plans, delineate the general policies, procedures and requirements for development of the necessary plans, and the evaluation of the effectiveness of the developed plans, in meeting national water quality objectives. Primary emphasis is given to the actions necessary to implement current regulations, appended hereto, on grants for water pollution control. Procedures for the processing and coordination of plans are set forth, along with sample plans and organizational charts. Guidelines for the development of water quality management plans for basins and for metropolitan regional areas are delineated, including the methodology of quality prediction and strategies resulting in cost effective solutions for waste water disposal problems within the planning area. Procedures, criteria and responsibilities for EPA evaluation and acceptance of the plans and construction grant applications are defined and described. (Smiljanich-Florida)
W71-08427

WATER QUALITY CONTROL IN CALIFORNIA: A REGIONAL APPROACH,
Richard N. Schwartz.
California, Western Law Review, Vol 7, No 1, p 138-160 (1970). 23 p, 136 ref.

Descriptors: *California, *Water quality control, *Regional analysis, *Water pollution control, Administration, Water management (Applied), Water quality, Water requirement, Supervisory control (Power), Pollution abatement, Local governments, Long-term planning, Integrated control measures, Water districts, Sewage districts, State jurisdiction, Non-structural alternatives, Political aspects, Regulation, Project planning, Legislation, Legal aspects.

Examined in this note are the difficulties confronting California's regional water quality control boards implementing regional water quality plans. Organizational structure, plan formulation, and enforcement procedures under current law are emphasized. Each of California's nine regional boards represents a major watershed. Regional planning establishes the following elements: (1) protected beneficial uses, (2) water quality objectives, and (3) implementation programs. Regional policy is implemented in a two-step process: (1) implementation of waste discharge requirements, and (2) imposition of legal sanctions enforcing discharge requirements. This reliance on abatement rather than preventative enforcement has rendered the multi-community approach adopted in one region ineffective. It has been suggested that regional boards be statutorily granted the authority to institute the consolidation, dissolution, or reorganization of sewerage districts. This would allow inter-community coordinated waste disposal and more effective long-range water quality planning. Current statutory prohibitions upon board power to specify the means of waste discharge compliance is warranted. Allowing direct regional water quality control through sewerage district reorganization would make California's water quality system far more effective. (Earl-Florida)
W71-08428

A BILL TO AMEND THE CLEAN AIR ACT AND THE FEDERAL WATER POLLUTION CONTROL ACT TO PROVIDE FOR STANDARDS FOR THE MANUFACTURE OF CERTAIN PRODUCTS TO PROTECT THE QUALITY OF THE NATION'S AIR AND NAVIGABLE WATERS.
Senate Bill 573, 92d Cong, 1st Sess (1971). 20 p.

Descriptors: *Industrial production, *Pollutant identification, *Water pollution control, *Legislation, Legal aspects, Federal jurisdiction, Federal government, Water pollution sources, Chemical wastes, Non-structural alternatives, Industrial wastes, Organic compounds, Institutional constraints, Navigable waters, Water quality control, Administrative agencies, Administrative decisions, Environmental effects, Analytical techniques, Path of pollutants, Toxins, Supervisory control (Power), Standards, Regulation, Air pollution.
Identifiers: *Federal Water Pollution Control Act, *Clean Air Act.

Authorizing the implementation of standards for substances utilized in manufacturing processes, this bill would amend both the Federal Water Pollution Control Act and the Clean Air Act. The bill's purpose is the protection of the nation's air and navigable waters. The Administrator of the Environmental Protection Agency is required to designate substances used in manufacturing which adversely affect public health or violate air or water quality standards. Prior to the introduction of any previously unused manufacturing substance, the manufacturer would be required to: (1) provide the name, concentration, purpose, and chemical composition of such substance; (2) conduct health tests; (3) supply all available information relating to environmental effects of the substance; and (4) describe techniques for detecting such substance. The Administrator would prescribe utilization standards whenever a substance might result in adverse discharges into the air or navigable waters. Such standards must include testing techniques and reporting requirements. The manufacture, import, or export of products not conforming to promulgated standards would be unlawful. Products which fail to conform to appropriate standards would be subject to libel, seizure, and condemnation. Judicial procedures, including criminal contempt and injunctive measures, would be governed by procedures set forth in the bill. (Earl-Florida)
W71-08429

CALIFORNIA'S TIDELAND TRUST: SHORING IT UP,
Peter C. Davis.
Hastings Law Journal, Vol 22, No 3, p 759-781 (1971). 23 p, 160 ref.

Descriptors: *California, *Coasts, *Land use, *Environmental effects, Beds, Ownership of beds, Public rights, Public benefits, Wetlands, Tidal marshes, Tidal waters, Coastal marshes, Shores, Water resources development, Human population, Administration, Damage, Balance of nature, Ecology, Exploitation, Community development, Preferences (Water rights), Legal aspects, Legislation, Judicial decisions.

Traditionally limited to promoting commercial, fishing, and navigational interests, California's tidelands trust is explored in this article as a vehicle to protect tideland ecological integrity. The public trust doctrine evolved through Roman, English, and American law. The development of the trust in California resulted from legislative actions and judicial construction. The terms of the trust are analyzed and set forth in eleven points by the author. Enforcement of the trust by both the state and private citizens is examined. Historically, trust administration has been characterized by an ecologically unsound promotion of commercial interests. Precedent exists for reappraising the trust's 'public interest' concept in terms of environmental quality. Recent California legislation should provide the courts with a mandate for such a reappraisal. A new approach is needed to put commercial tideland projects into perspective. Environmental advocates will attempt to expand the trust. If the courts listen, the legacy of past ecological abuse need not be accepted in the future. (Earl-Florida)

FIRST ANNUAL REPORT ON THE STATE OF THE NATION'S ENVIRONMENT--MESSAGE FROM THE PRESIDENT OF THE UNITED STATES,
Richard M. Nixon.
117 Cong Rec 505-512 (daily ed Feb 18, 1971). 8 p.

Descriptors: *Environment, *United States, *Water pollution control, *Non-structural alternatives, Federal government, Planning, Administrative agencies, State governments, Local governments, Water pollution, Pollutants, Pollution abatement, Air pollution, Land use, Land resources, Water resources, Water resources development, Parks, Recreation, Water pollution sources, Taxes, Ecology, Federal project policy, Pesticides, Legislation.
Identifiers: *Presidental messages.

This President's Report on the State of the Environment is divided into six parts. Part One considers strengthening of pollution control programs and proposes corrective measures including charges on sulfur oxides and leaded gasoline, water pollution controls, pesticide control authority, and a federal procurement program for paper recycling. 'Controlling Emerging Problems' is the topic of part two, which proposes regulation of toxic substances, regulation of noise pollution, and controls on ocean dumping. To promote environmental quality in land use decisions, the President proposes in part three: (1) a national land use policy; (2) an open space and recreational program bringing parks to urban areas; (3) preservation of historic buildings through tax policy; (4) expansion of the wilderness areas preservation system; (5) public agency approval of power transmission line routes; and (6) mining regulations. In part four, expanded international cooperation and a world heritage trust are proposed. Establishment of an environmental institute is recommended in part five. In part six, the role of the individual citizen in improving the environment is stressed. (Harris-Florida)
W71-08431

A BILL TO PRESERVE AND PROMOTE THE RESOURCES OF THE CONNECTICUT RIVER VALLEY.
Senate Bill 36, 92d Cong, 1st Sess (1971). 14 p.

Descriptors: *Connecticut, *Legislation, *National historic parks, *National recreation areas, Vermont, New Hampshire, Massachusetts, Federal government, State governments, Local governments, Administration, Regulation, Administrative agencies, National parks, Public lands, Federal reservations, Recreation, Conservation, Ecology, Rivers, Interstate rivers, River basins, Compensation, Condemnation value, Land tenure, Legal aspects.

The Connecticut Historic Riverway would be established by this proposed bill. Under the bill, the United States shall preserve the natural ecological environment of the Connecticut River Valley Corridor, develop the recreational potential of the area, and encourage maximum complementary action by state and local governments and private individuals, groups and associations. The bill provides for the acquisition of title to lands and scenic easements. Provisions for the taking of private land as well as the rights of the private holders are specified. Regulations shall be issued to carry out the provisions of this bill, but such regulations shall not discourage the constructive development and use of land for industrial and commercial purposes which are consistent with the purposes

this bill. The duties and responsibilities of the Secretary of the Interior, Federal Power Commission, National Park Service, Secretary of Agriculture, and Secretary of the Army are detailed. The Connecticut Historic Riverway Advisory Committee is established by the bill, and its membership is explained. (Robinson-Florida)
W71-08432

A BILL TO AMEND THE ACT OF MARCH 3, 1899, RELATING TO PENALTIES FOR WRONGFUL DEPOSIT OF CERTAIN REFUSE, INJURY TO HARBOR IMPROVEMENTS, AND OBSTRUCTION OF NAVIGABLE WATERS.
Senate Bill 679, 92d Cong, 1st Sess (1971). 2 p.

Descriptors: *Coastal structures, *Engineering structures, *Legislation, *Federal government, Coastal engineering, Financing, Rivers, Harbors, Legal aspects, Public rights, Public benefits, Federal jurisdiction, Water policy, Damages, Wastes, Waste disposal, Waste dumps.

Section 16 of the Act entitled 'An Act making appropriations for the construction, repair, and preservation of certain public works on rivers and harbors, and for other purposes' (33 USC 411) shall be amended by striking out in the first sentence thereof the following: 'twenty-five hundred dollars nor less than five hundred dollars', and adding in lieu thereof '$100,000', and by placing immediately after this first sentence the following new sentence: 'In the case of any violation which continues over a period of time, each day such violation continues shall be a separate violation for the purposes of this section.' (Robinson-Florida)
W71-08433

A BILL TO PROVIDE THAT STATE LAWS OR REGULATIONS WITH RESPECT TO CERTAIN ENVIRONMENTAL MATTERS SHALL NOT BE PREEMPTED OR NULLIFIED BY FEDERAL LAW.
Senate Bill 675, 92 Cong, 1st Sess (1971). 1 p.

Descriptors: *Environment, *Water pollution, *Water pollution control, *Legislation, Air pollution, Legal aspects, Federal government, State governments, Local governments, Regulation, Water law, Pesticides, Herbicides, Waste disposal, Wastes.

Under this proposed legislation no provision of federal law shall preempt or nullify any state law, local ordinance, or regulation for the prevention or regulation of air or water pollution, noise, the use of pesticides or herbicides, or the disposal of solid waste until such time as regulations in lieu of such state law or regulation are put into effect by or pursuant to federal law. (Robinson-Florida)
W71-08434

VIOLATIONS OF LAWS PROTECTING NAVIGABLE WATERS.
Corps of Engineers, Washington, D.C.

33 Code of Federal Regulations, Sec 209.170 (1970). 5 p.

Descriptors: *Rivers and Harbors Act, *Navigation, *Administration, *Navigable waters, Legal aspects, Legislation, Hazards, Accidents, Ships, Harbors, Adoption of practices, Water quality control, Water pollution control, Pollution abatement, Pollutant identification, Abatement, Water quality, Administrative agencies, Supervisory control (Power), Tidal waters, Structures, Construction, Waste disposal, Regulation, Federal jurisdiction.
Identifiers: Administrative regulations.

The substance, enforcement procedures, and penalties for violation of statutes protecting navigable waters are herein outlined. Constructing structures over or in navigable waters requires local permission and Corps of Engineer plan approval. Department of Transportation approval is required for bridges and causeways. The Secretary of the Army's navigational authority extends to artificial islands and outer continental shelf structures. Statutes governing wrecks in navigable waters forbid such activities as: (1) obstructing navigable channels, (2) permitting or causing vessels to be sunk in navigable waters, and (3) the floatation of certain materials in navigated channels. Owners of sunken vessels are required to properly mark such craft. Willful or negligent actions causing vessels to be sunk constitute a misdemeanor. Injury to government works related to navigation is prohibited. The discharge or deposit of refuse matter into or on the banks of navigable waters, tributaries thereof, or certain tidal waters is forbidden. Penalties and enforcement procedures provided in statutes protecting navigation are herein detailed. District Engineers will note and secure enforcement of violations in his district. Such matters will be referred to the Chief of Engineers where parties deny or continue violations. (Earl-Florida)
W71-08435

OPERATION AND MAINTENANCE OF BEAR CREEK DAM AND RESERVOIR.

Code of Federal Regulations, Title 33, Ch 2, Sec 208.31 (1970). 2 p, 1 tab.

Descriptors: *Missouri, *Dams, *Reservoirs, *Reservoir operation, Reservoir storage, Water resources development, Projects, Regulations, Maintenance, Flood control, Flood damage, Water Levels, Water level fluctuations, Water management (Applied), Recreation, Water conservation, Federal government, Cities, Spillways, Engineering structures, Construction, Streams, Streamflow, Discharge (Water).

Having completed the Bear Creek dam and reservoir project in Missouri, the United States Army Corps of Engineers turned it over to the city of Hannibal, Missouri, to be operated and maintained through a superintendent employed by the city in accordance with this regulation. In order to control floods, water levels are prescribed. Water may not be stored to create or maintain a conservation or recreation pool. The superintendent shall regulate the reservoir so as to reduce as much as possible flood damage below the reservoir. The regulation prescribes in what situations water may be released from the reservoir. The superintendent shall operate and maintain the reservoir in accordance with the Corps' manual. He shall furnish the District Engineer with reports on the operation and condition of the dam and with hydrological data as called for. A table prescribes water elevations for the reservoir. The regulations are subjected to temporary modification by the District Engineer in time of emergency. (Duss-Florida)

Identifiers: Oil leases, Presidential messages.

The President of the United States herein submits to Congress a special message requesting legislation to terminate oil exploration leases in the Santa Barbara Channel and to create a marine sanctuary. The State of California had attempted to protect a part of its coastline by creating a state sanctuary and closing it to all petroleum exploration. The federal government, however, subsequently issued leases for petroleum exploration immediately seaward from the state sanctuary. A blowout in the Channel resulted in widespread oil pollution of the sanctuary. Legislation being submitted would terminate all but three leases and create a marine sanctuary. The continuation of the three leases is necessary to avoid further marine pollution as high pressure oil would escape through zones of structural weaknesses if not bled off. These leases would continue under strict management controls. This recommendation is based on the belief that immediate economic gains are outweighed by considerations of wildlife preservation and the quality of life in America. (Smiljanich-Florida)

AN ACT RELATING TO THE ESTABLISHMENT AND IMPLEMENTATION OF PUBLICLY FINANCED EROSION CONTROL AND BEACH RESTORATION PROJECTS.

Florida Laws Ch 70-276, p 869-876 (1970).

Descriptors: *Florida, *Beach erosion, *Boundaries (Property), *Erosion control, Beaches, Riparian land, Beds, Beds under water, Relative rights, Shore protection, Washouts, Real property, Land tenure, Riparian rights, Priorities, Coastal engineering, Administration, Administrative decisions, Adoption of practices, Ownership of beds, Tidal effects, Land management, Administrative agencies, State governments, Legislation, Legal aspects.

Publicly financed beach nourishment and restoration programs are hereby declared to be in the public interest. Upon request for such programs, the Trustees of the Internal Improvement Fund shall require the Department of Natural Resources' approval or disapproval. In determining project priority, the Trustees shall consider relative needs, equipment availability, and federal and local contributions and cooperation. The Trustees shall conduct a survey establishing the restoration area and an erosion control line. No control lines shall be established absent the consent of a majority of affected riparian owners. To receive evidence as to the merit of a project, the Trustees shall, after notice, hold a public hearing. On motion of aggrieved persons, Trustee decisions shall be judicially reviewable. Title to lands seaward of the erosion control line shall be deemed in the state upon the filing of the Trustee's resolution and recording of the erosion control line. Common law principles shall not subsequently alter upland property proportions, but persons divested of riparian title shall continue to enjoy all other riparian rights. Under conditions herein specified projects may be cancelled and established erosion control lines may be voided. (Earl-Florida)
W71-08438

AN ACT TO PROVIDE THAT A RIPARIAN OWNER SHALL CONSENT BEFORE DREDGING MAY BE DONE FOR A PUBLIC PURPOSE.
Florida Laws Ch 70-147, p 497-498 (1970) amending Fla Stat sec 253.12 (5). 2 p.

Descriptors: *Florida, *Riparian land, *Riparian waters, *Dredging, Real property, Land tenure, Relative rights, Riparian rights, Navigable waters, Riparian water loss, State governments, Local governments, Eminent domain, Construction, Public rights, Earthworks, Channel improvement, Excavation, Beaches, Erosion control, Beach erosion, Legal aspects, Legislation, Constraints, Drainage programs.

An amendment to an existing chapter of legislation, this act provides that nothing in the chapter shall be construed to permit any state agency, county, city, or political subdivision to conduct construction or extension operations on lands bordering or in navigable waters, nor to drain such waters, unless such agency is or holds the written consent of the upland riparian owner as herein defined. However, nothing in this amendment shall limit the right of eminent domain concerning such projects. This

amendment shall not be applicable where the Trustees of the Internal Improvement Fund are authorized to establish erosion control lines to implement beach nourishment, replenishment, or erosion control programs. (Earl-Florida)
W71-08439

AN ACT ESTABLISHING THE FLORIDA ENVIRONMENTAL INVENTORY COUNCIL.
Florida Laws ch 70-316, p 945-949 (1970).

Descriptors: *Florida, *Resource allocation, *Ecological distribution, *Administrative agencies, Legislation, Water resources, Land resources, Natural resources, State governments, Wildlife, Grasslands, Forests, Conservation, Resources, Resource development, Soil conservation, Inspection, Environments, Administration, Coordination, Evaluation, Animal populations, Aquatic life, Beaches, Census, Plant populations.

The Florida Environmental Inventory Council is hereby created as an advisory council to the Department of Natural Resources. The Council's membership shall consist of the administrative heads of: (1) the departments of Commerce, Transportation, Health, and Rehabilitative Services, Air and Water Pollution Control, Agriculture and Consumer Services, Administration, and Natural Resources; (2) the Public Service Commission, Game and Fresh Water Fish Commission, and Trustees of the Internal Improvement Trust Fund; and (3) five citizens nominated by the governor. It is the intent of the legislature to create the Council for a three-year period to advise the Department concerning an environmental inventory of Florida's natural resources. Under authority herein detailed, the Department shall develop and conduct such an inventory containing a statement of present resource use and affected environmental factors. Included in coastal area inventories shall be: (1) submerged or exposed, grassy productive areas; (2) algae-covered areas; (3) salt-loving plants; (4) estuarine areas; (5) salt water aquatic life; and (6) beach topography and stability. Watershed quality, stream circulation, and fresh water aquatic life shall be included in inland water inventories. Included in inland inventories shall also be: natural vegetation areas, soil quality and stability, and wildlife. (Earl-Florida)

THE FLORIDA WATER POLLUTION CONTROL AND SEWAGE TREATMENT PLANT GRANT ACT OF 1970.
Florida Laws ch 70-251, p 769-775 (1970).

Descriptors: *Florida, *Water pollution control, *Treatment facilities, *Grants, Water pollution treatment, Waste treatment, Sewage treatment, Sewage disposal, Sewage, Sewage districts, Local governments, State governments, Federal government, Legislation, Legal aspects, Project planning, Water quality control, Adoption of practices, Administrative agencies, Payment, Administration, Financing construction costs, Capital costs, Cost sharing.

The Florida Water Pollution Control Trust Fund is hereby established to be used for grants to local governmental agencies for sewage treatment facility construction. The Florida Air and Water Pollution Control Board shall implement this act and administer appropriated funds. Grants shall be made only to projects eligible for federal grants. No grants shall be made unless a facility is approved by, and subject to, Board-imposed conditions. The local agency must agree to pay costs exceeding state and federal grants. Grants shall not exceed 25% of costs eligible for federal grants. The local agency must adopt and submit for approval a comprehensive long-range water pollution control plan. This plant shall: (1) provide for construction preventing inadequately treated waste discharge; (2) provide planning, zoning, population projection, engineering, and economic studies; (3) comply with the state population control plan; (4) set forth timing, financing, construction, and operating proposals; and (5) be reviewed by local planners. The Board may administer planning grants and provide coordinating technical assistance. Projects shall be funded in order of priorities established by the Board. The Board may advance funds equal to approved, but not yet available, federal grants. (Earl-Florida)
W71-08441

AN ACT AUTHORIZING DRAINAGE, WATERSHED IMPROVEMENT, AND SOIL CONSERVATION DISTRICTS TO ENTER INTO AGREEMENTS WITH THE UNITED STATES FOR THE CONTRACTING OF IMPROVEMENT WORKS.
Act 152, Acts of Arkansas, p 440-443 (1969). 4 p.

Descriptors: *Arkansas, *Water districts, *Contracts, *Construction, Drainage districts, Watershed management, Soil conservation, Bids, Institutional constraints, Projects, Federal government, United States, Construction costs, Engineering structures, Administrative agencies, Legislation, State governments, Legal aspects.

Three prior acts are hereby amended to authorize drainage districts, watershed improvement districts, and soil conservation districts to enter into contracts with the United States for the construction of improvement works and awarding of contracts therefor. The construction of the improvements and the awarding of contracts are to be by, and under the control and supervision of, the United States or any of its agencies. The advertisement, award, and carrying out of the contracts shall be in accordance with the applicable federal agency laws. (Smiljanich-Florida)

POLITICS OF WATER,
Colorado State Univ., Fort Collins. Dept. of Political Science.
Philip O. Foss.
Presented at an international symposium, 'Arid Lands in a Changing World,' Tucson, Arizona, June 1969. In: Arid Lands in Transition, Dregne, H E (ed), Pub No 90, AAAS, p 165-173, 1970. 4 ref.

Descriptors: *Political aspects, *Social impact, *Water law, *Water policy, Water resources development, Decision making, Water rights, Environmental effects, Social values, Institutions, Political constraints.
Identifiers: *Oases.

The populations of arid lands may be divided into 2 major groups: (1) a small diffuse rural population, diminishing in both size and importance in most nations; (2) concentrated oasis populations, usually rapidly growing, which control national politics. In areas of water scarcity, water may be allocated through the use of force, the market system, or the political system. Though often camouflaged, force is used extensively. Because of the necessity of high risk capital and limited profits the market system is inefficient and usually gives way to political allocation. Rapid growth of oasis communities, intensification of the problems of population concentration, and development of new uses for water--all significant environmental changes associated with an affluent society--will inevitably create further demands on such a political water system responsive to economic growth forces and demands for protection of existing rights. (Casey-Arizona)

FLORIDA AQUATIC WEED CONTROL ACT.

Fla Laws ch 70-203, p 613-616 (1970) 4 p.

Descriptors: *Florida, *Aquatic weeds, *Water pollution control, *Aquatic plants, Legislation, Public health, Recreation, Water hyacinth, Administrative agencies, Research facilities, Financing, Costs, United States, Natural resources, Water resources development, Permits.

Authorizing the Florida Department of Natural Resources to direct state activities relating to aquatic plant control, this Act and amendments to existing Florida statutes outline the department's duties and provide for coordination with other administrative agencies. The basic public policy is to vest authority for aquatic plant control in the Department so as to protect human health, safety, and recreation and to as far as possible prevent injury to plant and animal life and property. It is the Department's duty to coordinate the aquatic weed control activities of all public agencies. It may delegate these functions to the Division of Game and Fresh Water Fish. The Department shall also have responsibility for promoting, developing, and supporting research activities relating to aquatic plant control. The Department's powers in this area are outlined. The Act also delineates the procedure whereby the Department may disburse funds to local agencies for aquatic plant control. An amendment to the Florida statute on hyacinth control gives the Florida Game and Fresh Water Fish Commission the authority to cooperate with the United States with respect to hyacinth eradication, subject to the rules and regulations of the Department. A BILL TO AMEND THE FEDERAL DISASTER ACT TO PROVIDE ASSISTANCE FOR THE REHABILITATION AND RECONSTRUCTION OF AREAS DAMAGED BY FLOODS AND HIGH WATERS.

Senate Bill 1793, 89th Cong, 1st Sess (1965).

Descriptors: *Floods, *Flood damages, *Compensation, *Disasters, Government finance, Flood water, Flood protection, Water injury, Damage, Water level fluctuations, Property values, Land reclamation, Rehabilitation, Construction, Grants, Financing, Debt, Loans, Projects, Urban renewal, Flood plain insurance, Insurance, Administrative agencies, Federal government, Legislation, Legal aspects.
Identifiers: *Federal Disaster Act.

In response to extensive property loss and severe damage often resulting from floods and high waters, the Federal Disaster Act would be amended by this proposed legislation to provide assistance for the rehabilitation and reconstruction of damaged areas. Federal-aid highway systems damaged by floods and high waters would be repaired or reconstructed with federal money. The Secretary of Agriculture would be authorized to compromise or release borrower indebtedness under various administrative programs as he finds necessary because of losses resulting from floods and high waters. The Housing and Home Finance Administrator would also be authorized to compromise or release specified indebtedness. He could issue urban renewal project grants for reconstruction and redevelopment of damaged land. Other necessary civil works projects by the Corps of Engineers would be authorized by the Act. Provisions would be made for federal assistance to states for the retiring or adjustment of private mortgage obligations. Regulative provisions under the Act would take into consideration the reasonable foreseeability of loss by floods or high waters in the affected areas, the availability and presen

demnification, and the applicant's failure to take lequate precautions against the damage. (Smil-nich-Florida)

BILL TO AMEND THE OIL POLLUTION CT TO IMPLEMENT THE PROVISIONS OF HE INTERNATIONAL CONVENTION FOR HE PREVENTION OF THE POLLUTION OF HE SEA BY OIL.

nate Bill 2017, 89th Cong, 1st Sess (1965).

escriptors: *International waters, *Waste posal, *Ships, *Oily water, Oil, Oil wastes, ater pollution sources, Water pollution, Waste mps, Pollution abatement, Pollutants, Water pol-ion control, Water quality control, International , Oil industry, Treaties, Federal government, gislation, Legal aspects.

order to implement the provisions of the Interna-nal Convention for the Prevention of the Pollu-n of the Sea by Oil, the Oil Pollution Act of 1961 uld be amended in several respects by this posed legislation. The definitions of the terms ' and 'ship' would include specified distinctions d certain ships would be expected from the visions of the Act. A new provision would incor-rate the definition of the term 'from the nearest d' as defined in the Convention. Under the Act, amended, the discharge of oil or oily mixture m specified ships and tankers would be hibited or subject to prescribed regulations. rtain discharges, however, would be excepted m the prohibition. The zone of prohibition uld include all sea areas within fifty miles from nearest land, subject to extensions or reduc-ns effectuated in accordance with the terms of Convention. Provisions would be made for the intenance of oil record books by every ship and ker subject to the Act. Such books would con-detailed records of any discharge of oily water. niljanich-Florida)

JAW ISLAND FREIGHT AND TERMINAL V CITY OF BUFFALO (PRIOR NOTICE REQUIREMENT FOR POLLUTION SUIT AGAINST CITY).
133 Misc 64, 231 NYS 139-145 (Sup Ct 1928).

Descriptors: *New York, *Sewage, *Water pollution, *Adjudication procedure, Water pollution sources, Rivers, Damages, Sewers, Overflow, sands, Gravels, Islands, Land, Land tenure, Cities, Sewage disposal, Legal aspects, Judicial decisions.

Plaintiff sand and gravel company sought to restrain defendant city from continuing to discharge sewage into a river. Plaintiff also sought to recover for damages to plaintiff's property caused by the sewage already discharged by defendant. Plaintiff owned land on an island from which it took sand and gravel. It alleged that defendant's sewage had formed a margin around the island and also covered the surface of the island, thereby rendering the sand resources worthless. Defendant contended that plaintiff had not followed the requisite procedure for suing the city in that the city charter required that no action on a claim could be brought against the city until the expiration of forty days after the filing of the claim with the city council. The supreme court agreed with defendant's contention and dismissed plaintiff's complaint without predjudice. (Duss-Florida)

ROSSI V CITY OF SCHENECTADY (CONDITIONS PRECEDENT TO SUIT AGAINST MUNICIPALITY FOR FAULTY SEWERS).
133 Misc 792, 233 NYS 512-515 (Sup Ct 1929).

Descriptors: *New York, *Flood damage, *Storm drains, *Adjudication procedure, Local governments, Sewers, Sewage, Floods, Floodwater, Surface runoff, Surface waters, Surface drainage, Damages, Storm runoff, Water injury, Legislation, Judicial decisions, Legal aspects.

Plaintiff resident sought damages from defendant municipality after sewer back up and overflow flooded plaintiff's premises. Plaintiff timely filed a statutorily required notice of claim stating his residence and that the faulty sewer was 'in said vicinity.' Plaintiff contended the defendant had negligently constructed the sewer. Defendant moved for dismissal, alleging plaintiff's notice had failed to explicitly describe the faulty sewer's location and, therefore, did not meet the statutory condition precedent to suit. The Supreme Court, Schenectady County, held that a description enabling municipal authorities to determine, with reasonable diligence, the location of a defective sewer, suffices to meet statutory requirements of notice prior to suit. Plaintiff's description of residence coupled with a statement alleging negligence in the backing up of sewers 'in said vicinity' provided defendant with adequate notice of the plaintiff's claim. Defendant's motion to dismiss was denied absent any claim of misrepresentation. (Earl-Florida)
W71-08606

STACK V CITY OF NEW YORK (MUNICIPAL AND PRIVATE LIABILITY FOR SEWAGE OVERFLOW).
134 Misc 105, 234 NYS 486-489 (NY City Ct 1929).

Descriptors: *New York, *Flood damage, *Storm drains, *Sewers, Storm runoff, Cloudbursts, Overflow, Rain water, Surface runoff, Floods, Drainage system, Drainage system, Drainage practices, Drainage water, Drainage, Damages, Local governments, Real property, Land tenure, Historic flood, Cities, Legal aspects, Judicial decisions, Sewerage.

Plaintiff tenant sought damages from defendant landlord and from defendant city for losses incurred when a sewer overflow flooded her premises. The street abutting plaintiff's residence contained both a sanitary sewer and a rainwater drainpipe. During an extraordinary rainfall, water flowed over the gutter and into plaintiff's residence. Plaintiff contended defendant landlord knowingly maintained the premises below street level and that defendant city had negligently failed to provide an adequate drainage system. The City Court of New York held that: (1) absent fraud or express warranties, no cause of action against a landlord arises from flood damage to premises below the street grade; and (2) a city in constructing sewers is not bound to provide for extraordinary rainfalls and is not liable when, after such rainfalls, sewers back up and flood private premises. The court noted that plaintiff had failed to establish that sewage came onto the premises or that the drainpipe had been improperly constructed or maintained. Ruling that plaintiff had failed to state a cause of action against the landlord or establish the city's negligence, the court granted verdict for defendants. (Earl-Florida)
W71-08612

SMITH V VILLAGE OF VICTOR (OBSTRUCTING CULVERT AS NUISANCE OR NEGLIGENCE).
134 Misc 888, 236 NYS 566-570 (Sup Ct 1929).

Descriptors: *New York, *Culverts, *Obstruction to flow, *Adjudication procedure, Flood damage, Highways, Streams, Cities, Maintenance, Flow, Overflow, Construction, Land, Land tenure, Damages, Legal aspects, Judicial decisions, Surface runoff.

Plaintiff sought to recover from defendant village for flood damages to his building. The flooding was caused by a clogged culvert maintained by defendant. Plaintiff alleged that the creation and maintenance of this condition amounted to a nuisance and that his damages were sustained by reason of the nuisance. Defendant moved to dismiss on the ground that defendant's action was based on negligence and that village law prohibited negligence suits against the village unless a written, verified statement of the claim was filed in the village within thirty days after the cause of action accrued. The trial court granted defendant's motion. It was the village's duty to maintain the culvert which became obstructed. However, plaintiff's action was grounded in negligence. Therefore, he was required to comply with the village law regarding filing a statement of claim. At best, plaintiff's action was a nuisance action based on negligence, and, as such, the notice rules applicable to negligence would be applied. (Duss-Florida)
W71-08621

CITY OF THOMSON V MCCORKLE (DAMAGES CAUSED BY OVERFLOW OF DRAINAGE SYSTEM).
171 SE 186-187 (Ct App Ga 1933).

Descriptors: *Georgia, *Drainage systems, *Overflow, *Adjudication procedure, Obstruction to flow, Drains, Drainage, Surface drainage, Surface waters, Rainfall, Cities, Surface runoff, Damages, Legal aspects, Judicial decisions.

Plaintiff property owner sued defendant city to recover damages caused by an overflow of water from defendant's drainage system. Plaintiff in his first petition alleged that defendant's negligent 'maintenance' of the drainage system caused the overflow and plaintiff's damages. Later, plaintiff amended this first petition to allege that defendant had negligently allowed the drainage system to become clogged. In so amending the petition, plaintiff omitted the earlier allegation of negligent maintenance. Defendant at trial attempted to enter the fact of such omission into evidence against plaintiff. The trial court refused to admit such evidence, a verdict was rendered for plaintiff, and defendant appealed on the ground that it was error to reject this evidence and to accept certain other evidence. The Court of Appeals of Georgia reversed. It was error to reject evidence of the stricken allegations. Such evidence would properly tend to show an admission by plaintiff that damage was caused by the inadequate construction of the

drainage system and not by an obstruction of the drains. However, it was not error to admit, in support of showing the condition at the time of the overflow, evidence showing the condition of the drains after the overflow. (Duss-Florida)
W71-08627

HILL V CITY OF WINTERSET (DAMAGES FOR CITY'S MAINTENANCE OF NUISANCE).
214 NW 592-593 (Iowa 1927).

Descriptors: *Iowa, *Sewage, *Water pollution, *Adjudication procedure, Sewers, Ditches, Cities, Septic tanks, Cesspools, Drainage, Construction, Discharge (Water), Watercourses (Legal), Storm drains, Odor, Public health, Judicial decisions, Legal aspects, Damages, Relative rights, Legislation.

Plaintiff landowner brought suit against defendant city to recover damages for maintenance of a nuisance. Defendant had constructed a storm sewer along a public street adjacent to plaintiff's property, and this sewer discharged into an open ditch near plaintiff's premises. Defendant also connected drains from septic tanks and cesspools to the storm sewer, thereby causing the discharge to become offensive and obnoxious. Plaintiff's complaint was based on the offensive nature of this nuisance. Plaintiff received a verdict and defendant appealed. The Supreme Court of Iowa affirmed. The statute under which the action was brought was sufficiently broad to allow introduction of evidence concerning the health hazards of the nuisance, even though plaintiff's claim was based on the obnoxious odors caused by the nuisance. Portions of the evidence regarding sanitary aspects in the utilization of septic tanks were immaterial but were not prejudicial to defendant's case. (Duss-Florida)
W71-08678

STOVERN V TOWN OF CALMAR (MEASURE OF WATER POLLUTION DAMAGES TO LESSOR OF RIPARIAN LAND).
216 NW 112-115 (Iowa 1927).

Descriptors: *Iowa, *Water pollution, *Leases, *Remedies, Pollution abatement, Reasonable use, Riparian rights, Treatment facilities, Water pollution effects, Odor, Municipal wastes, Damages, Sewage, Sewage disposal, Sewage treatment, Rent, Land tenure, Riparian land, Evaluation, Local governments, Cities, Judicial decisions, Legal aspects.

Plaintiff landlord sued defendant city to enjoin a nuisance and to recover damages. Plaintiff contended that defendant dumped sewage into a stream bordering plaintiff's property, thereby causing him injury in the amount of reduced rental value to a tenant leasing the land. Defendant contended that an injunction was not appropriate as the city had begun construction of a sewage disposal plant. Defendant also contended that plaintiff could not use reduced rental value of the land as his measure of damages because such damages were for injury to the right of occupancy and comfortable enjoyment of the premises, which belonged only to the tenant. The Supreme Court of Iowa affirmed the lower court judgment awarding damages to plaintiff, but remanded the granting of an injunction for further taking of evidence. The court noted that the nuisance had commenced prior to plaintiff's leasing of the property. Where a nuisance is in existence at the time when land is leased by the owner and such nuisance depreciates the rental value of the property, the owner may recover, among other items, damages for the amount of the reduced rental value. (Smiljanich-Florida)
W71-08689

STOVERN V TOWN OF CALMAR (ABATEMENT OF WATER POLLUTION NUISANCE THROUGH CONSTRUCTION OF SEWAGE DISPOSAL SYSTEM).
224 NW 26-27 (Iowa 1929).

Descriptors: *Iowa, *Pollution abatement, *Sewage disposal, *Remedies, Treatment facilities, Water pollution, Riparian rights, Local governments, Cities, Reasonable use, Water pollution treatment, Streams, Sewage treatment, Sewers, Outlets, Industrial wastes, Industrial plants, Judicial decisions, Legal aspects.
Identifiers: *Injunction (Prohibitory).

Plaintiff landowner sought to enjoin an alleged nuisance caused by defendant city's emptying of sewage into a stream. Plaintiff contended that, although a sewer system had been built by the city subsequent to the commencement of the action, the city continued to pollute the stream. Defendant contended that the nuisance complained of had been abated by the construction of the sewer system. Defendant also contended that, although a private company had continued to pollute the stream through a sewer outlet unknown to the city, such pollution had ceased after the city instructed the company to cut off their sewer. The lower court determined that damages were allowable, but an injunction was not necessary as the pollution had been abated. The Supreme Court of Iowa, in affirming the lower court dismissal of the injunction, noted that subsequent to the cessation of the private sewer outlet, the stream became clear and odorless. Where a city has subsequently constructed a modern and sufficient sewer disposal system, an injunction to abate the water pollution is unnecessary. (Smiljanich-Florida)
W71-08692

THE FEDERAL NAVIGATION SERVITUDE: IMPEDIMENT TO THE DEVELOPMENT OF THE WATERFRONT,
Eugene J. Morris.
St John's Law Review, Vol 45, No 2, p 189-199, 1970. 11 p, 37 ref.

Descriptors: *Federal government, *Navigation, *Non-navigable waters, *Land tenure, Real property, Social needs, Navigable rivers, Navigable waters, Federal jurisdiction, Administrative decisions, Human population, Ownership of beds, Permits, Relative rights, Riparian land, Riparian rights, Social impact, Compensation, Condemnation value, Political constraints, Construction, Legal aspects, Judicial decisions, Legislation, Rivers and Harbors Act.
Identifiers: *Navigational servitude.

The navigational servitude doctrine, its impact upon waterfront development, and the need for modifying it to meet new priorities are examined in this article. Navigational servitude is defined as the federal right to compel the removal of navigational obstructions without compensation. This right constitutes a cloud on shorefront real property titles, inhibiting real estate development. In congested urban areas with declining port facilities, the doctrine prevents needed housing and industrial shorefront development. Because of their procedural difficulty and infrequency, congressional declarations of non-navigability are depicted as inadequate. Recent expansions of Corps of Engineer authority over construction permits in navigable waters and the effect of state regulation are considered. Proposals authorizing the Secretary of the Army to issue irrevocable or limited permits for shoreline development are discussed. A recent proposal authorizing the Secretary of the Army to study new procedures to allow waiver or modification of navigational servitude is described. The author concludes that continued judicial affirmation of the navigational servitude doctrine does not remove the need for its reassessment in light of changing priorities. (Earl-Florida)

TATE TAX INCENTIVES TO FIGHT POLLU- ION,
hn W. McNulty.
merican Bar Association Journal, Vol 56, p 747-50, 1970. 4 p, 18 ref.

escriptors: *Pollution abatement, *Treatment cilities, *Tax rate, *Legislation, State jurisdic- on, Taxes, State governments, Industrial wastes, ater pollution control, Water pollution treat- ent, Administration, Air pollution, Water pollu- on, Abatement, Environmental sanitation, Coor- nation, Financial feasibility, Interstate, Non- ructural alternatives, Capital costs, Economic stification, Government supports, Investment, gal aspects.
entifiers: *Tax incentives.

ax incentives for industrial pollution control cilities have not been in the limelight of current vironmental conflicts. This article examines the ture and adequacy of state pollution abatement x incentives. The revenue-producing laws of at ast thirty-one states embody such provisions. In ost states, pollution control facility certification quires that the facility be 'primarily' for the con- ol, reduction, or elimination of air or water pollu- on. The author views this requirement as limiting e effectiveness of incentives. Because the Inter- l Revenue Code's definition of pollution control cilities is tied into state law, this requirement also pairs the availability of federal pollution control ite-offs. Incentive categories discussed include:) property tax exemption, (2) sales and use tax emption, (3) income tax credits, and (4) anchise tax exemptions. The failure of several in- strial states to adopt incentives is noted, as is the ncept of focusing incentives on a particular urce of pollution, such as automobiles. The thor concludes that: (1) statutory uniformity ould increase incentive utilization; (2) a full spec- um of incentives is needed; and (3) a re-examina- n of the primary purpose doctrine, aimed at tablishing realistic certification standards, would useful. ONTINENTAL SHELF OIL DISASTERS: HALLENGE TO INTERNATIONAL POLLU- ON CONTROL,
nnis M. O'Connell.
rnell Law Review, Vol 55, p 113-128, 1970. 16 93 ref.

scriptors: *Water pollution, *Oil, *Oil industry, ontinental Shelf, Marine geology, Oceans, ater pollution effects, Water pollution sources, ater pollution control, Pollutants, Pollution atement, Legislation, International law, Interna- nal waters, Legal aspects, Law of the sea, Marine imals, Marine plants, Plankton, Marine fish, gulation, United States, Foreign waters, Foreign untries.
ntifiers: *Oil Pollution Act.

e Santa Barbara Channel oil spill and the Torrey nyon disaster illustrate the need for international ion to prevent oceanic oil pollution. In addition the birds and mammals imperiled by oil spills, h spills may result in a mass destruction of es- tial organisms in the food chain of marine life. o, tiny sea plants produce an overwhelming per- ntage of the world's oxygen, and continuing pol- ion could create serious oxygen depletion. sent legislation--the Oil Pollution Acts of 1924 d 1961 and the Clean Waters Restoration Act of 66--provides insufficient protection from pollu- n, although the provisions of the Water Quality Improvement Act are a great improvement. International regulation of oil pollution was attempted in a twenty-nation convention, but the convention applies only to ships of the signatories in their territorial waters. Current international regulation of the Continental Shelf takes a nationalistic approach to pollution, depending on the licensing nation to protect itself from pollution. The International Maritime Consultative Organization may provide more effective international regulation of pollution at sea. (Hart-Florida)

FOREWORD TO SYMPOSIUM--LAW AND THE ENVIRONMENT,
Edmund S. Muskie.
Cornell Law Review, Vol 55, No 5, p 663-665, 1970. 3 p.

Descriptors: *Pollution abatement, *Environment, *Water pollution, *Air pollution, Cities, Public rights, Water pollution sources, Water pollution effects, Water pollution control, Legal aspects, Environmental effects, Industries, Pollutants, Waste treatment, Water pollution treatment, Local governments, Legislation.

As the great industrial cities of the United States grew, the affluent citizens lived in the northern and northwestern portions of the cities, since the prevailing winds from those directions prevented contact with industrial pollution. However, pollution now affects all segments of the society. Tolerating pollution ultimately is more expensive than permitting it; hence many citizens support immediate expenditure of necessary funds to abate pollution. The Water Quality Act and the Air Quality Act are based upon a conviction that public standards for air and water quality should govern uses of air and water resources. Air pollution emissions must be controlled to satisfy air quality standards of the region; water pollution should be controlled through joint treatment plants between municipalities and industry. Legislation controlling pollution from vehicles and boats, as well as noise pollution, is required. To accomplish pollution abatement, a majority of Americans must adopt new attitudes. Furthermore, extensive planning for environmental protection by both private and public concerns is necessary. The law must provide protection for the environment. (Hart-Florida)

LEGISLATION AND THE ENVIRONMENT: INDIVIDUAL RIGHTS AND GOVERNMENT ACCOUNTABILITY,
Richard L. Ottinger.
Cornell Law Review, Vol 55, No 5, p 666-673, 1970. 8 p, 18 ref.

Descriptors: *Environment, *Pollution abatement, *Federal government, *Legislation, Public rights, Public health, Environmental effects, Administrative agencies, Administrative decisions, New York, New Jersey, Ecology, Marine animals, Marine plants, Water pollution, Water pollution sources, Water pollution effects, Water pollution control, Pollutants, Sewage, Industrial wastes, Hudson River.
Identifiers: *Constitutional amendment.

Man has viewed his environment as a horn of plenty. However, the relationship between man and the environment has reached a critical stage, and public concern with the pollution threat has generated a rash of proposed solutions. Whether the proposals will ultimately abate pollution is questionable, because the real problem is that our institutions are rooted in notions of inexhaustible supply of natural resources. A near-catastrophic example of the failure of our institutions to act is the 'Dead Sea' at the mouth of New York Harbor. The 20 square mile area is totally devoid of marine life because the area lacks sufficient oxygen. This condition is the direct result of sewage and industrial waste being dumped into the sea and the Hudson River. Although federal laws exist to avert ecological catastrophes such as that of New York Harbor, the failure of our agencies to act under the law results from the public's failure to establish a clear social policy for environmental protection. Since statutes may be easily amended, a constitutional amendment is necessary to protect the environment, along with coordination of federal action, judicial review of agency action, and individual concern for the environment. (Hart-Florida)

THE RIGHT TO A DECENT ENVIRONMENT: E—MC2: ENVIRONMENT EQUALS MAN TIMES COURTS REDOUBLING THEIR EFFORTS,
E. F. Roberts.
Cornell Law Review, Vol 55, p 674-706, 1970. 33 p, 90 ref, 1 append.

Descriptors: *Environment, *Legal aspects, *Pollution abatement, *Air pollution, Water pollution, Pollutants, Industries, Water pollution control, Water pollution sources, Water pollution effects, Federal government, State governments, Local governments, Cities, Air pollution effects, Public health, Adjudication procedure, Judicial decisions.
Identifiers: *Constitutional rights.

Seeking a means to enforce man's right to a decent environment, this article first analyzes several nuisance decisions which refused to enjoin industrial pollution by applying the balancing of interests theory. The selection of sites for industrial plants was considered a major factor in the decisions. Next, the author postulates that a nuisance may amount to constitutionally prohibited inverse condemnation. He also suggests that local governments condemn development rights on their peripheries, i.e. require municipal consent for development as a part of regional environmental and economic planning integration. Constitutional amendments establishing a right to an environment fit to sustain healthy human life are suggested. The author believes that a similar constitutional right to a decent environment might be found as a part of substantive due process. However, the impact of such a constitutional holding is seen to require that agencies merely give sufficient weight to environmental considerations in their decisions. It is observed that a constiutional right to a decent environment would not seriously depart from the grundnorm. Included by appendix is one commissioner's objection to establishment of a nuclear plant in Diablo Canyon, a project approved by the California Public Utility Commission. (Hart-Florida)

THE WILD AND SCENIC RIVERS ACT OF 1968,
A. Dan Tarlock, and Roger Tippy.
Cornell Law Review, Vol 55, p 707-739, 1970. 33 p, 135 ref.

Descriptors: *Wild rivers, *River systems, *Scenery, *Recreation, Condemnation, Eminent domain, Scenic easements, Natural resources, Aesthetics, Conservation, Parks, Roads, Legislation, Federal government, State governments, Legal aspects, Judicial decisions, Administrative agencies, Administrative decisions, Water pollution, Water resources, Water resources development, Banks, Water pollution control.

The Wild and Scenic Rivers Act is a counterweight to federal dam-building programs and limits development of certain rivers and their banks in the name of recreation. The Act is a reaction to the profusion of dams and reservoirs and seeks to preserve some rivers in their natural state. Eight rivers were initially protected; in addition, 27 more rivers were designated for potential inclusion after further study. Protection may be extended to three types of rivers defined in the Act. Either scenic easements or fee simple title in lands contiguous to the rivers may be acquired. The river corridors are to be managed to emphasize aesthetic, scenic, historic, and archeological features. The Act does

not provide for judicial review of administrative decisions concerning the corridors; however, courts tend to find such decisions reviewable under the Administrative Procedure Act. Also, water resources programs inconsistent with the Act are restricted. The state reservation doctrine is apparently subservient to the Act under the supremacy clause. Although the Act provides only a vague reference to control of pollution, control of the river corridor should prevent pollution from waste discharge. (Hart-Florida)

AGRICULTURE: THE UNSEEN FOE IN THE WAR ON POLLUTION,
N. William Hines.
Cornell Law Review, Vol 55, p 740-760, 1970. 21 p, 111 ref.

Descriptors: *Agriculture, *Water pollution, *Pesticides, *Fertilizers, Chemicals, Farm wastes, Nitrogen compounds, Phosphorus compounds, Water pollution sources, Water pollution effects, Irrigation practices, Leaching, Confinement pens, Domestic wastes, Soil disposal fields, Waste disposal, Eutrophication, Waste assimilative capacity, Salinity, Saline soils, Salt tolerance, Sedimentation, Sediment Control, Soil conservation.

Agricultural wastes have received practically no attention in recent efforts to prevent and abate water pollution. Control of municipal and industrial wastes may be cancelled by failure to control the four major sources of agricultural pollution: animal wastes, chemicals, sediment, and salt. Pollution from animal wastes results primarily from the use of feed-lots to fatten beef. Feedlot runoff is high in oxygen demand, depleting oxygen supplies in streams; furthermore, the various nutrients in such wastes cause eutrophication. Pollution from feedlots may be controlled by treating drainage and disposing of accumulated solid wastes, although the latter solution has proved difficult. Both agricultural fertilizers and pesticides are major factors in water pollution. Fertilizer, through its chief nutrients--nitrogen and phosphorus--is also responsible for eutrophication. Moreover, use of fertilizer is virtually unregulated. Although pesticide usage is strictly regulated, present regulations are not directed towards water pollution. The potential harm of pesticides has not been thoroughly evaluated. Quantitat ively, sediment is the most serious agricultural water pollutant; inefficiency of soil conservation districts is primarily responsible. Excessive salinity affects agricultural productivity. Irrigation increases the problem, and an adequate solution has been evasive. (Hart-Florida)

LEGAL PLANNING FOR THE TRANSFER OF WATER BETWEEN RIVER BASINS: A PROPOSAL FOR THE ESTABLISHMENT OF THE INTERBASIN TRANSFER COMMISSION,
Michael D. White, and Charles P. Eddy.
Cornell Law Review, Vol 55, p 809-845, 1970. 37 p, 236 ref.

Descriptors: *Inter-basin transfers, *Water resources development, *Water supply, *Water transfer, Water rights, Appropriation, Natural flow doctrine, Preferences (Water rights), Prior appropriation, Riparian rights, Competing uses, Relative rights, Reasonable use, Legislation, Eminent domain, Condemnation, Compensation, Federal government, State governments, Navigation, Interstate commissions, River basin commissions, Interstate rivers, Water policy, Equitable apportionment.

Although water scarcity in particular areas might be alleviated by interbasin transfers, this solution is prevented by the absence of cooperative water resources management. Traditional water law protects stream water rights in the source basin either by the prior appropriation or the riparian rights doctrine. Rights in underground water are also protected by various doctrines. In addition, water rights in the area of origin may be protected by state statutes, federal legislation, or anti-export statutes. Acquisition of vested water rights in the area of origin is a major obstacle to interbasin transfers. Transfer planners must decide: (1) which uses in the transferee basin should be favored at the expense of which uses in the transferor basin, (2) whether water rights may be obtained by purchase or condemnation, and (3) the value of water rights so obtained. Additionally, the federal government may take water rights without exercising the eminent domain power under the proprietary power or the navigation power. States may also take water rights without compensation under the navigation servitude. However, an effective organization for arranging interbasin transfers is lacking; therefore, a new federal agency, the Interbasin Transfer Planning Commission, is required to coordinate transfers with river basin commission. (Hart-Florida)
W71-08703

ENVIRONMENTAL CONTROL: HIGHER STATE STANDARDS AND THE QUESTION OF PREEMPTION,
Samuel C. V. D. Kilbourn.
Cornell Law Review, Vol 55, p 846-860, 1970. 15 p, 70 ref.

Descriptors: *Legal aspects, *Pollution abatement, *Federal governments, *State governments, Judicial decisions, Legislation, Water pollution, Air pollution, Water pollution control, Federal jurisdiction, State jurisdiction.
Identifiers: Constitutionality.

A recently enacted Minnesota statute imposes stricter radiation controls than do Atomic Energy Commission regulations; the statute has been challenged on the basis of the pre-emption doctrine. This conflict may be a prototype of future controversies in the environmental control area. The federal-state conflict arises from the state power to protect the public health and welfare vis-a-vis federal powers under the general welfare clause. Since the Constitution explicitly pre-empts state action in only a few areas, federal pre-emption is generally implied from the breadth of federal regulation and the supremacy clause. However, whether preemption has occurred is a matter for the courts. A determination of implied supersedure of state action chiefly amounts to judicial balancing of competing federal and state interests. However, a presumption in favor of concurrent state power assists the courts in upholding state action. Moreover, state action involving potentially violent labor picketing has been upheld despite the pervasiveness of the Taft-Hartley Act. Analogously, state environmental protection laws may be sustained despite federal nationwide pollution control efforts. (Hart-Florida)

WATER POLLUTION CONTROL IN VERMONT: A SYSTEM OF EFFLUENT CHARGES,
Hobart Birmingham.
Journal of Law Reform, Vol 4, No 1, p 135-147, 1970. 13 p, 73 ref.

Descriptors: *Vermont, *Water pollution control, *Water quality control, *Water permits, Legislation, Effluents, Economic justification, State governments, Pollution abatement, Water pollution, Administration, Administrative decisions, Administrative agencies, Legal aspects, Permits, Water quality, Waste disposal, Wastes, Waste water (Pollution), Judicial decisions, Non-structural alternatives, Environmental sanitation, Water policy, Supervisory control (Power), Adoption of practices.
Identifiers: *Effluent charges.

Examined in this note are the strengths and weaknesses of Vermont's 1970 water pollution control law. Basically, the Act directly regulates water quality standards through the issuance of discharge permits. However, it includes provision for tempo-

rary, non-complying permits coupled with effluent charges based upon damage to downstream use. Permanent permits will be granted only upon finding that the quality of receiving water will not be diminished below established standards. By incorporating and upgrading existing quality standards, the Act could result in virtually pollution free waters. In the author's view the Act's effectiveness will depend upon: (1) administrative flexibility in adjusting discharge levels, (2) judicial interpretations of 'receiving waters', and (3) utilization of discretionary and judicial remedies. Possible adverse consequences of balancing economic and water quality standards are considered. The Act's effluent charge provision is examined with respect to its: (1) use in balancing interests, (2) underlying economic rationale, and (3) utility as a pollution abatement incentive. The author concludes that the Act falls short of model status in that it misconstrues the goal of effluent charges and attempts to combine two distinct water management systems. (Earl-Florida)

SAVING BYRON'S SEA: FEDERAL AND STATE REGULATION OF OIL POLLUTION FROM OCEAN PETROLEUM PRODUCTION,
William John Rathje.
Hastings Law Journal, Vol 22, No 3, p 485-5[illegible] 1971. 38 p, 178 ref.

Descriptors: *Oil wells, *Oily water, *Water pollution sources, *Oceans, Drilling, Offshore platforms, Federal government, State governments, California, Legislation, Submerged Lands Act, Administrative agencies, Inspection, Control, Remedies, Continental Shelf, Natural resources, Water pollution, Water pollution control, Pollutants, Damages, Resource development, Regulation, Public rights, Marine geology.

Discussing the problem of oil pollution from offshore petroleum drilling, the main concern of this article are the existing legal controls designed to minimize the incidence of oil pollution resulting from the development of marine petroleum resources. The author considers the situation that exists in California and identifies both the federal and state law designed to prevent oil spill incidents. He also points out inadequacies in government controls and makes some recommendations for new legislative action. Attention is also given to the rights of private individuals damaged by oil spills. The Department of the Interior and two of its subagencies exercise jurisdiction over ocean petroleum development. Regulationg governing oil drilling inform operators of their responsibility to avoid pollution and set minimum technical standards for operation of wells. The principal deficiencies in the Federal program result from inadequate inspection of offshore drilling operations and the absence of sanctions. California is more rigorous in its control as its provisions concerning responsibilities and technical standards are buttressed by sanctions and systematic inspections. The author also considers the geological problems involved in offshore drilling and the need for increased government regulation in this area to improve the safeguards against pollution. (Duss-Florida)
W71-08706

THE LAW OF WATER DISTRIBUTION IN IOWA AND SOUTH DAKOTA: A COMPARISON OF THE RIPARIAN AND APPROPRIATIVE SYSTEMS,
Max A. Gors.
Drake Law Review, Vol 20, No 2, p 256-287, [illegible] 32 p, 418 ref.

Descriptors: *Iowa, *South Dakota, *Water allocation (Policy), *Appraisals, Water policy, Water permits, Legislation, Judicial decisions, Appropriation, Water utilization, Legal aspects, Regulation, Reasonable use, Artificial use, Competing uses, Natural flow doctrine, Prior appropriation, Relative rights, Riparian rights, Water rights, Comparative benefits, Preferences (Water rights), Prior rights, Riparian waters, Riparian land, Administration

legal theories underlying surface and ground-
er distribution in Iowa and South Dakota are
yzed and contrasted in this article. The
elopment of water law is determined by climate,
graphy, topography, and use. The history,
elopment, principles, and nature of prior ap-
priation and riparian doctrine in semi-arid
th Dakota, and of riparianism in more humid
, are examined. Riparian principles relating to:
land ownership; (2) natural watercourses; and
the doctrines of natural flow, reasonable use,
icial use, and non-riparian use are analyzed by
author. The nature and history of appropriative
rests in South Dakota are examined. A com-
son of diffused surface water theory in both
s is made. Differing rules control underground
ams and percolating groundwater. The com-
law and prior appropriation rules governing
olating groundwater are analyzed. The sources
uthority for water distribution administration in
states are contrasted in terms of: (1) policy,
non-regulated uses, (3) regulations, and (4)
stitutional questions. The procedures, duration,
ileges and rights, and nature of the interest
ted by each state's water permit system are
yzed. (Earl-Florida)

POLLUTION REGULATIONS.
st Guard, Washington, D.C.

Code of Federal Regulations, part 151, 1970. 4

criptors: *Oil wastes, *Water pollution control,
ips, *Coast Guard regulations, Adoption of
ctices, Water pollution sources, Boats, Oily
er, Storage tanks, Water quality control, Super-
ry control (Power), Pollutants, Pollution abate-
t, Regulation, Administration, Administrative
isions, Sea water, Legal aspects, Legislation,
ties.
ntifiers: Oil Pollution Act of 1961.

e administrative regulations set forth herein im-
ment the Oil Pollution Act of 1961, which in
n implements the International Convention for
Prevention of Pollution of the Seas by Oil. Sub-
t to certain exceptions, the regulations are ap-
cable to any seagoing vessel of American registry
nationality. Foreign vessels to which the Con-
tion applies may be boarded and examined in
S. territorial waters. Employees of the Corps of
gineers, the Bureau of Customs, and the Coast
ard are designated to board vessels, make in-
ctions, require the production of records, and arrest violators. All sea areas within 50 miles of land, and the eleven zones herein described, are prohibited zones. An oil record book shall be maintained and descriptive entries made after the following operations: (1) ballasting or discharge of tanker ballast, (2) cargo tank cleaning, (3) slop tank settling or water discharge, (4) disposal of oily residues, (5) ballasting or cleaning bunker-fuel tanks, and (6) exceptional or accidental oil discharges. Upon the completion of foreign voyages, such book shall be delivered to the Coast Guard. The record book shall remain on board during and after non-foreign voyages. Penalties for violations of these regulations are contained in the Oil Pollution Act of 1961. (Earl-Florida)
W71-08709

MAINTENANCE OF WATER LEVELS AT TWO RESERVOIR PROJECTS.

33 Code of Federal Regulations, Title 33, Ch 2, secs 208.65, 208.66, 1970. 4 p.

Descriptors: *Alabama, *Reservoir operation, *Flood control, *Water levels, Reservoirs, Dams, Reservoir storage, Water storage, Discharge (Water), Hydroelectric plants, Hydroelectric power, Regulation, Administrative agencies, Administration, Outlets, Rivers, Projects, Federal government.

In the interest of flood control, the Alabama Power Company, as owner and operator of two dam and reservoir projects, shall operate them in accordance with regulations promulgated herein by the United States Army Corps of Engineers. The water levels at both projects are to be maintained according to their respective Storage Delineation Curves (top-of-power-pool curves). Specific provisions prescribe the circumstances, ways, and quantities in which water may be released and discharged. Releases made in accordance with these regulations are subject to the condition that they shall not be made in a manner inconsistent with protecting the dams and reservoirs from major damage. The power company shall furnish to the District Engineer such hydrological data as may be necessary to monitor the flood control operations of the projects. These regulations are subject to modification by the District Engineer if conditions make such modification desirable. (Duss-Florida)
W71-08710

POLLUTION OF THE GREAT LAKES AND SOLID WASTE DISPOSAL AT SEA.
116 Cong Rec H 3068 (daily ed), 4 US Code Cong and Admin News p 1095-1096 (1970). 2 p.

Descriptors: *Great Lakes, *Dredging, Waste dumps, *Oceans, Water quality control, Water pollution control, Federal government, Pollution abatement, Legislation, Legal aspects, Spoil banks, Water pollution sources, Environmental effects, Disposal, Environmental engineering, Pollutants, Municipal wastes, Garbage dumps, Investigations, Administration, Adoption of practices, Leadership, State governments.
Identifiers: Presidential messages.

This Presidential message to Congress deals with: (1) administration proposals to restrict polluted dredge-spoil dumping in the Great Lakes; and (2) the initiation of a study examining solid waste disposal in the oceans. The administration's bill, aimed at restoring the Great Lakes, would: (1) discontinue polluted dredge-spoil disposal by the Corps of Engineers and private interests, (2) require that such disposals be made in containment areas, (3) require states and other non-federal sources to provide one-half the cost of such containment areas, and (4) suspend Corps of Engineer dredging after one year if local interests fail to make reasonable progress in establishing containment areas. Periodic program progress reports would be made by the Secretary of the Army. The Council on Environmental Quality has been directed, in conjunction with other federal, state and local agencies, to undertake a comprehensive study of ocean dumping. This study will examine the following areas: (1) the effects of ocean dumping on the environment, (2) the adequacy of existing legislation, (3) amounts and areas of toxic dumping, (4) the availability of land disposal sites, (5) alternative disposal methods, (6) suggested innovative ideas, and (7) institutional problems. (Earl-Florida)
W71-08711

LIABILITY FOR OIL POLLUTION CLEANUP--NON-SELF-PROPELLED BARGES EXEMPTED UNDER CERTAIN CIRCUMSTANCES.

Federal Register, Vol 36, No 43, p 4293-4294, Mar 1971. 2 p.

Descriptors: *Oil, *Water pollution sources, *Regulation, *Administrative agencies, Water pollution, Navigable waters, Federal government, Legislation, Navigation, Transportation, Harbors, Bodies of water, Fuels, Administrative decisions, Water pollution control.

Setting forth the Federal Maritime Commission's regulation covering financial responsibility for oil pollution cleanup, this report by the Commission discusses the exemption from liability under the financial responsibility section. Section 11 (p) (1) of the Federal Water Pollution Control Act as amended requires every vessel exceeding a certain size to maintain evidence of financial responsibility in case of discharge of oil into waters of the United States. However, the Rivers and Harbors Act of 1970 (Public Law 91-611) excludes from financial responsibility non-self-propelled barges carrying no oil as cargo or fuel. In order to conform to this new law the Commission amended its regulations, including new sections defining 'cargo' and 'fuel'. Several shipping organizations and companies submitted comments to the Commission in favor of a less restrictive definition of fuel than the one proposed by the Commission so as to permit the carrying of small quantities of oil aboard non-self-propelled barges used to operate machinery on these barges. The Commission rejected the contentions of these parties. For purposes of their regulations 'fuel' means any oil used or capable of being used to generate heat or power by burning. (Duss-Florida)
W71-08712

ENVIRONMENTAL INFORMATION.
Environmental Science Services Administration, Washington, D.C.

15 Code of Federal Regulations, part 907, 1970. 1 p.

Descriptors: *Weather data, *Weather forecasting, *Publications, *Meteorological data, Weather, Technical writing, Climatic data, Storms, Snow, Rain, Data collections, Forecasting, Charts, Maps, Libraries, Information retrieval, Documentation, Statistics, Environment, Flow profiles, Ocean currents, Tides, Seismic waves, Seismology, Weather patterns.
Identifiers: *Environ Science Serv Admin.

The types and availability of information disseminated by the Environmental Science Services Administration (ESSA) are herein described. ESSA gathers, processes, and issues information on : (1) weather conditions, (2) river water height, (3) coastal tides and currents, (4) ocean current movement, (5) ocean basin shapes and structures, (6) seismic activity, (7) precise earth shape and size, and (8) space and upper atmospheric conditions. Hurricane, tornado, flood, and seismic sea-wave warnings are also issued. ESSA information falls into three categories: (1) current information and warnings on dynamic environmental conditions; (2) charts, historical summaries, graphic recordings, and other longer term information; and (3) technical earth science research. Current information is disseminated either directly, through

local offices, or through relaying mediums. A Daily Weather Map and a Weekly Weather and Crop Bulletin may be ordered through the Superintendent of Documents, Washington, D.C. Longer term information may be purchased through local sales agents or through ESSA. Price lists and catalogs are available. Information concerning scientific and technical research publications may be obtained. (Earl-Florida)
W71-08713

COUNTY DITCH NO. 13, JACKSON COUNTY V BOARD OF COUNTY COMMISSIONERS (BOARD'S DENIAL OF PETITION TO IMPROVE DITCH FOUND REASONABLE).

182 NW2d 715-717 (Minn 1971).

Descriptors: *Minnesota, *Drainage, *Ditches, *Controlled drainage, Land, Land tenure, Construction, Culverts, Surface waters, Rainfall, Damages, Surface drainage, Surface runoff, Legislation, Judicial decisions, Legal aspects.

Plaintiff landowners petitioned to have a drainage ditch benefiting their land improved because it was of insufficient capacity to handle additional drainage. The county board of commissioners dismissed the petition, stating that the proposed improvement was not practicable and would not benefit the public. One petitioner appealed to the district court, which affirmed the county board's ruling. The Supreme Court of Minnesota affirmed the district court. In matters involving construction and improvement of drainage facilities a substantial amount of discretion lies with the governmental body first having jurisdiction over the matter. Their decisions will not be overturned unless there is no legal basis for them. The evidence here supported the district court's determination that the county board's denial of the petition was not arbitrary, unlawful, nor unsupported by the evidence. (Duss-Florida)
W71-08714

HOLBROOK V APPLEBERRY (RIGHTS AND RESPONSIBILITIES OF ADJACENT LANDOWNERS IN COMMON DRAINAGE DITCH)
463 SW2d 100-102 (Ark 1971).

Descriptors: *Arkansas, *Ditches, *Easements, *Drainage, Judicial decisions, Legal aspects, Boundaries (Property), Farms, Overflow, Drainage water, Surface runoff, Land tenure, Land, Relative rights.

A determination of the respective rights and responsibilities of appellee and appellant landowners in a common drainage ditch was sought. The ditch ran down their common boundary, across appellant's tract, and into a bayou. The ditch was constructed under an oral agreement between appellee and appellant's now deceased husband; both contributed to the construction costs. The chancellor held that: (1) the ditch was mutual and common, (2) each party possessed a drainage easement across the lands of the other, (3) neither party could obstruct the drain without consent of the other, (4) the parties could have the ditch restored to its former depth and width, and (5) each party should maintain the ditch on his own land. Appellant contended that these findings were unsupported by the evidence and that appellee had purchased additional land draining into the ditch. The Arkansas Supreme Court upheld the chancellor's finding and rejected appellant's assertion that appellee was surcharging the easement. The court found that the evidence failed to demonstrate which party had caused the ditch to become overburdened with water. (Hart-Florida)
W71-08715

CITY OF GLADSTONE V HAMILTON (DAMAGES FOR CONDEMNATION WHERE NO SPECIAL BENEFIT INURES TO THE LANDOWNER)
463 SW2d 622-626 (Ct App Ky 1971).

Descriptors: *Missouri, *Condemnation, *Adjudication procedure, *Sewers, Eminent domain, Damages, Compensation, Cities, Easements, Right-of-way, Legal aspects, Judicial decisions, Urbanization.

Plaintiff municipality brought action against defendant landowner to condemn a sewer easement. Plaintiff asserted that defendant was not damaged by the taking. After instructing the jury on damages, the trial court gave the following instruction on plaintiff's motion: 'your verdict must be for plaintiff . . . if you do not believe that the defendants have been damaged.' The jury found no damages. However, the Kansas City Court of Appeals stated that any taking implied at least nominal damages, and a verdict of no damages was authorized only when plaintiff had shown special benefits inuring to defendant which exceeded his damages. Since plaintiff had not provided evidence of special benefits, the court held that the jury instruction for plaintiff was prejudicial error and was not consistent with the rules of procedure. The action was remanded for a new trial. (Hart-Florida)
W71-08716

CHIPLEY V BEELER (LIABILITY FOR ALTERING FLOW OF SURFACE WATER).
178 SE2d 767-769 (Ct App Ga 1970).

Descriptors: *Georgia, *Surface runoff, *Ridnce (Legal aspects), *Repulsion (Legal aspects), Drainage water, Surface waters, Surface drainage, Culverts, Drainage effects, Drainage practices, Drainage, Damages, Local governments, Relative rights, Paving, Construction, Alteration of flow, Water pollution, Ponds, Easements, Real property, Land tenure, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff upper landowner sought to enjoin defendant down-hill property owners from obstructing the natural flow of surface water. The construction of plaintiff's driveway by the county had caused polluted surface water to accumulate on defendants' property. A subsequent extension of plaintiff's drainage pipe caused such water to flow into defendants' pond. Defendants sealed this pipe causing water to back up on plaintiff's property. Plaintiff claimed an interference with his drainage easement. Defendants, counterclaiming, sought an injunction and both punitive and special damages for plaintiff's diversion of polluted waters. The trial court entered injunctions against both parties. The plaintiff appealed a jury verdict on defendants' counterclaim. The Georgia court of appeals held that one who accepts a county's construction of a driveway altering the natural flow of surface water is liable for special and punitive damages arising from such alteration of flow. Plaintiff by accepting the driveway ratified the tortious act committed. The fact that defendants' pond had been made useless for swimming and fishing supported the verdict. (Earl-Florida)

TEXAS GAS TRANSMISSION CORP V KINSLOW (VALUATION OF SPRING IMPAIRMENT).
461 SW2d 69-72 (Ky 1970).

Descriptors: *Kentucky, *Damages, *Pipelines, *Springs, Cold springs, Groundwater, Percolating water, Spring waters, Confined water, Seepage, Fresh water, Real property, Land tenure, Right of way, Subsurface waters, Subsurface flow, Permeability, Contracts, Claims (Contracts), Legal aspects, Judicial decisions, Adjudication procedure, Groundwater movement.

Plaintiff farm owners sought damages from defendant pipeline owner for impairment of a spring. Defendant's installation of a gas pipeline has permanently dried up a spring on one of plaintiffs' two adjoining tracts of land. Plaintiffs contended that they granted the pipeline right-of-way in return for an oral agreement to compensate them for any spring impairment. Defendant appealed as excessive, a judgment in favor of the plaintiffs. The K tucky Court of Appeals held a determinatio damages to a multi-tract farm, from the impairm of a spring, must be based upon: (1) a before after market valuation of all tracts as a si economic unit; (2) the diminution in market va absent evidence the impairment can be cured; (3) testimony restricted to the highest and potential uses of the farm. Plaintiffs' pa evidence regarding defendant's compensa agreement was held admissible as consideratio plaintiffs' agreement. Determining plain damages had not been properly valued, the c reversed the judgment. (Earl-Florida)

STEPPED-UP WAR ON POLLUTION.
US News and World Report, p 20-21, Jan 11, 2 p.

Descriptors: *Water pollution, *Air poll *Federal government, *Industries, State go ments, Water pollution control, Pollution a ment, Administrative agencies, Administ decisions, Administration, Regulation, Legisl Judicial decisions, Legal aspects, Effluents, I trial wastes, Discharge (Water), Waste water lution), Taxes, Clean Air Act, Environment vironmental effects.
Identifiers: *National Air Quality Standards *Refuse Act, *Environmental Protection Age

Concern over America's environment is cha from talk to action. The federal governm promulgating more stringent standards to pr air and water pollution. The Environmental P tion Agency is requiring 40,000 industrial pla furnish information concerning effluent disc into waters. In addition, the Treasury Depar has announced tax incentive deprec schedules for pollution control equipment fines are being levied for violation of pollutio trol standards. The National Air Quality Stan Act and the Environmental Protection Agen being used to clean up the air. States, too, enacted environmental protection laws; Il Pennsylvania, Michigan, Florida, and Cali are examples. Additionally, industry is incr actiont to prevent pollution. However, many tries are concerned that the new laws will enforced even-handedly and are being cons changed and tightened; hence, spending for tion abatement by industry is being de Meanwhile, in the courts, lawsuits are being and injunctions sought. A chart in this arti dicates that federal pollution control expend have increased from $768 million in 1969, estimated $1,386 million in 1971. (Hart-Flori

THE COASTAL RESOURCES MANAGEMENT PROGRAM OF TEXAS: A SUMMARY.

Coastal Resources Management Program, Interagency Natural Resources Council, A Report to the 62nd Texas Legislature, Dec 1970. 15 p.

Descriptors: *Texas, *Inter-agency cooperation, *Coasts, *Water resources development, *Water management, Legislation, Federal government, State government.
Identifiers: *Interagency National Resources Council, *Texas Coastal Resources Management Program.

This interim report on the Coastal Resources Management Program of Texas is presented by the Interagency National Resources Council, a consortium of State agencies. Fifteen major problems involving the national resources of the Coastal Zone of Texas are examined. The Coastal Resources Management Program has approached the Coastal Zone environment as a balanced system composed of 21 major components needing both individual and interrelated studies. Governmental roles in environmental management must be well defined to provide a clear understanding of Federal, State and local responsibilities and authority. Over 500 environmental bills pending congressional action in Washington would affect the natural resources of the Texas Coastal zone. The Senate and House bills, 'National Estuarine and Coastal Zone Management Act of 1970,' and a Senate bill, the 'National Land Use Policy Act,' are described. The conclusions of this report illucidate the important need for a role of the Texas Coastal Resources Management Program. Specific actions are recommended to the Texas 62 Legislature, including cooperation with the Interagency Natural Resources Council to accomplish nine itemized tasks pertaining to the natural resources of the Coastal Zone. A two-year work plan would include eleven areas of needed investigations. (McEntyre-PAI)

DONALDSON V CITY OF MARSHALL (LIABILITY OF CITY FOR IMPROPER MAINTENANCE OF TILE DRAIN).

247 Mich 357, 225 NW 529-530 (1929).

Descriptors: *Michigan, *Tile drains, *Floods, *Obstruction to flow, Repulsion (Legal aspects), Surface drainage, Drainage, Drains, Surface runoff, Submergence, Sewers, Natural flow doctrine, Alteration of flow, Relative rights, Drainage effects, Drainage systems, Natural flow, Drainage water, Local governments, Cities, Judicial decisions, Legal aspects.

Plaintiff landowner sued defendant city to recover damages for the accumulation of water on plaintiff's land. The damage was allegedly caused by the faulty construction of a tile drain and failure to keep the drain free from obstruction to the natural flow of water. Plaintiff contended that the city failed to use reasonable care in the construction and maintenance of the drain. Defendant contended that it was under no obligation to drain plaintiff's land and denied negligence in the construction and maintenance of the drain. The Supreme Court of Michigan, in affirming a lower court judgment for plaintiff, noted that the city had the authority to establish a system of drainage. When a city establishes a drain, however, it becomes its duty to maintain the drain in such a way as to carry off the natural flow of the water. The city was therefore liable for any damages caused by water accumulating as a result of its failure to properly clean the drain. (Smiljanich-Florida)

HUGHES V VILLAGE OF NASHWAUK (LIABILITY OF CITY FOR NUISANCE CAUSED BY OVERFLOW OF SEWER).
225 NW 898-901 (Minn 1929).

Descriptors: *Minnesota, *Sewers, *Overflow, *Remedies, Sewage disposal, Waste water (Pollution), Surface drainage, Surface runoff, Drainage water, Sewage, Water pollution, Municipal wastes, Land tenure, Relative rights, Damages, Local governments, Cities, Judicial decisions, Legal aspects, Adjudication procedure.
Identifiers: *Nuisance.

Plaintiff landowner sued defendant city to enjoin a nuisance and to recover for damages caused by the nuisance. Plaintiff contended that defendant had abandoned a surface drainage system and caused the surface waters to be discharged into the city sewer system. Plaintiff also contended that the sewer system was inadequate for this purpose and had overflowed, discharging sewage into plaintiff's basement. Defendant contended that plaintiff had failed, as required by law, to give the city notice prior to bringing action. In affirming a trial court order that plaintiff had stated a cause of action, the Supreme Court of Minnesota noted that an owner or lawful occupant of property is entitled to maintain an action for an invasion of his property rights caused by a municipality casting sewage on the property and thereby creating nuisance. Plaintiff had based his claim upon nuisance--not upon negligence. An equitable action for injuction of a nuisance and damages does not require prior notice to the city. (Smiljanich-Florida)

NATIONAL POLICY FOR COASTAL MANAGEMENT,
Washington Univ., Seattle.
Edward Wenk.
Vital Speeches, Vol. 37, No. 6, p 177-181, January 1, 1971.

Descriptors: *Coasts, *Federal government, *Civil engineering, *Water policy, Water management, State governments.
Identifiers: NOAA.

Issues concerning the coastal zone, and policies urgently needed for its management, are examined. The primary issue is how to provide for the many diverse, conflicting coastal demands and still provide the greatest long-term social and economic benefits. Basic needs include a national policy to balance protection and development, comprehensive management plan prepared at the state level for all coastal land and water use, a state regulatory authority, public notices and hearings for management plan development and modification, ecological and policy research, and multi-jurisdictional cooperation. The formulation, operation and potential of the new U.S. National Oceanic and Atmospheric Administration (NOAA) are described. Three major issues the nation faces are 1) establishment of federal policy on coastal affairs, and funds for implementation; 2) development of state management programs; and 3) coastal research and technology development free of politics. The civil engineer should apply himself to the preservation of the coastal zone by public expression and vision, by participating in institutional frameworks for action, by seeking knowledge for better decisions, and by breaking down narrow technical specialization to better unite scientists and the public. (McEntyre-PAI)

TOWN OF LUMBER CITY V PHILLIPS (DUTY OF CITY TO CLEAN UP OPEN SEWAGE DITCH).

164 SE 681 (Ga 1932).

Descriptors: *Georgia, *Cities, *Sewage, *Ditches, Mosquitoes, Public health, Real property, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff landowners sought to enjoin defendant city from maintaining an open sewage ditch. Plaintiff alleged that the ditch was a nuisance as malodorous and a breeding place for mosquitoes. Defendant contended that since the ditch was present when plaintiff purchased his land, plaintiff took title subject to defendant's right to maintain the ditch. Defendant also asserted that plaintiff was required to keep the ditch open and repaired. However, the Supreme Court of Georgia held that defendant must abate the nuisance. The verdict of the trial court for the plaintiff was in accordance with the evidence. (Hart-Florida)

BOARD OF SUP'RS V CITY OF RICHMOND (RIGHT OF CITY TO CHARGE FOR SEWER SERVICES).
173 SE 356-361 (Va 1934).

Descriptors: *Virginia, *Natural flow, *Diversion, *Sewers, Conduits, Public health, Drainage, Rivers, Drainage systems, Cities, Sewage disposal, Administrative agencies, Contracts, Costs, Channels, Legal aspects, Judicial decisions.

Plaintiff city brought suit against defendant county board of supervisors to recover sewer charges relating to connection of the county with the city's sewer system. Plaintiff contended it was empowered to make the charges by authority of city ordinances and that the connection constituted a diversion of the natural flow of drainage from the county. Defendant contended that the connection followed the natural flow of drainage and that there had been a judicial determination that the county could not be charged for sewer connections under such circumstances. Defendant also contended that the ordinances relied upon by plaintiff were unlawful. The trial court found for plaintiff and the Supreme Court of Appeals of Virginia affirmed. The evidence supported a finding that the sewer connection was a diversion of the natural flow of drainage. The ordinances relied upon by plaintiff amounted to an offer by it to provide sewer services. Defendant knew of the ordinances, and acceptance of the services bound defendant for payment on a theory of implied contract. (Duss-Florida)

Identifiers: *Fire hazards, *Water-related problems, Rabbit, Coyote, Wood rat, *Greenbelts, Maloney Canyon (San Bernadino National Forest).

Water-related problems of the increasing southern California population include fire hazard, water supply, and waste disposal. A chaparral-covered ridge in Maloney Canyon, San Bernardino National Forest, was instrumented to study species composition before and after clearing, irrigation and introduction of new species. There are 70 vegetation species in the study area. Deer, rabbit, coyote, wood rat, birds and small rodents were inventoried. Forty-eight experimental plots were developed, 100 feet by 200 feet, for irrigation and introduction of 24 new plant species. Thirty-six plots will be irrigated with sewage, under automatic sprinkler control. The project is sponsored by 6 cooperators. Tables list species and water analyses. Figures show location, plot views, work crews, and treatment plant. (Popkin-Arizona)

Identifiers: Nuclear debris, Tennessee Valley Authority, Sulfur dioxide.

The Tennessee Valley Authority has been engaged in environmental protection since the agency was created in 1933, as a result of TVA's responsibility for development and protection of the resources in the Tennessee Valley and for improvement in agricultural practices and education. Several environmental protection projects that function as parts of the program for agricultural development and powerplant operation include: (1) studies of nuisance weed growth in reservoirs, (2) measurement of nutrient discharge from agricultural lands, (3) development of fly ash control methods, (4) research on sulfur dioxide removal from powerplant stack gases, and (5) investigation of environmental effects of waste heat from nuclear powerplants. Environmental protection is demonstrated at fertilizer production units operated by TVA. Also, other fertilizer producers are assisted with environmental problems because some TVA fertilizers possess properties useful in control of wastes in air. In cooperation with another Government agency, treatment and utilization of municipal waste as a soil amendment are being investigat

A PROPOSED STREAMFLOW DATA PROGRAM FOR NORTH CAROLINA,
Geological Survey, Raleigh, N.C.
G. C. Goddard, Jr., N. M. Jackson, Jr., E. F. Hubbard, and H. G. Hinson.
Geological Survey Open-File Report, 1970. 69 p, 2 fig, 1 plate, 9 tab, 19 ref, 2 append.

Descriptors: *Streamflow, *Network design, *Stream gages, *Programs, *North Carolina, Planning, Regression analysis, Flow rates, Data collections, Flow characteristics, Flow measurement, Base flow, Peak discharge, Gaging stations, Surface waters, Equations.

The proposed streamflow data program was based on an evaluation of the present program. This evaluation included classification of data needed, the setting of accuracy goals, and the analysis of data to determine if these goals had been met and to determine in what ways the program could be strengthened. Seventeen stations on primary streams (having drainage areas greater than 500 square miles) have adequate record to define streamflow characteristics and may be discontinued. Five new stations are needed to complete the primary network. Of 175 stations in operation, 7 stations are designated as long-term and 56 as current-purpose stations. Recommendations for expanded or new hydrologic studies include: (1) determination of time of travel and dispersive characteristics of streams, (2) investigation of public water supplies, and (3) expanded study and interpretation of data collected during periods of low streamflow. (Woodard-USGS)
W71-08932

A SYSTEM FOR DETECTING FLUORESCENT TRACERS IN STREAMFLOW,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
H. W. Steppuhn.
Available from the National Technical Information Service as PB-197 866, $3.00 in paper copy, $0.95 in microfiche. PhD Thesis, December 1970, 190p, 64 fig, 11 tab, 77 ref, append. Bureau of Reclamation Contract 14-06-DO-6598.

Descriptors: Tracers, *Streamflow, Hydrologic instruments, Theoretical analysis, Diffusion, Films, Gages, Gaging stations, Chemical properties, *Hydrographs, Experimental data, *Measurement, Sorption, Bibliographies, Accuracy, Velocity, Streamflow records.
Identifiers: Stream temperature, *Fluorescent tracers.

A system to monitor continuously the relative concentration of a fluorescent tracer in streamflow was developed. Streamside instrumentation automatically registers streamborne tracer concentrations as a function of time on a gelatin-coated film. The film is routed through a device which passes a continuous sample-aliquot diverted from the tracer-dosed stream over a small segment of the film. The exposed film is gathered periodically from streamsites and analyzed in a laboratory-based fluorometer. Use of the system is studied for gaging streamflow to: (1) produce a hydrograph, (2) measure stream discharge instantaneously, and (3) determine time-of-stream-travel. Hydrographs resulting from 640 hr of gaging 2 Colorado mountain streams with the system are compared to those obtained from closely located sharp-crested weirs. The maximum instantaneous deviation between hydrographs reaches 10%, the average absolute departure equals 1.8%, and the algebraic departure averages plus 0.3%. The system can be used when an expensive, temperature-sensitive fluorometer cannot be stationed streamside, and when the particular objectives of stream measurements do not justify the cost of conventional techniques, but fair accuracy and continuous records of short to moderate duration are desired.
W71-08940

7B. Data Acquisition

A NEW SYSTEM FOR THE AUTOMATIC MEASUREMENT AND RECORDING OF RAINFALL,
Royal Aircraft Establishment, Farnborough (England).
C. F. Lucas.
Available from the National Technical Information Service as AD-714 936, $3.00 in paper copy, $0.95 microfiche. Royal Aircraft Establishment Technical Report 70051, Mar 1970. 13 p, 7 fig, 1 ref.

Descriptors: *Rain gages, *Instrumentation, Telemetry, Data storage and retrieval, Equipment, Gages, Precipitation gages, Gaging stations.
Identifiers: Rain gages (Recording).

A system was developed to meet a need for a simple, accurate, automatic recording rain gage with a high degree of reliability. It is capable of recording very light falls of rain or drizzle and of handling the heaviest falls. Also, it can store the information within the gage itself, send the information out electrically, or be interrogated by telephone or radio, or all of these. The new gage is very suitable for incorporation in automatic data logging systems, and when so used can provide an accurate combined record of the time of onset and cessation of rain, the rate of rainfall, the quantity in each shower, and total rainfall. They have an efficiency between 99% and 110% compared to the 5 inch check gage, have a much greater resolution than existing recording rain gages and can be left unattended for long periods. In addition, the total rainfall can be retained for check purposes. Evaporation is reduced considerably, no losses occur during emptying, the mechanism is generally strong, no highly toleranced or critically balanced parts are

required, and the overall cost of manufacture is low. (KnappdUSGS)

APPLICATION OF AERIAL PHOTOINTERPRETATION METHODS IN HYDROLOGICAL STUDIES WITH SPECIAL REFERENCE TO THE PROBLEMS IN EASTERN INDIA,
Geological Survey of India, Calcutta.
Amit Kumar Roy.
Indian Geohydrology, Vol 5, No 1, p 58-64, Dec 1969. 7 p, 7 ref.

Descriptors: *Photogrammetry, *Aerial photography, *Hydrologic data, *Data collections, Topography, Mapping, Geomorphology, Surveys, Water resources development, Reviews, Hydrology, Hydrogeology, Drainage patterns (Geologic).
Identifiers: *India.

In the major river valleys of Eastern India and in the coastal plains of West Bengal and Orissa, photogeological studies are considered very advantageous in tackling various hydroproblems. Photointerpretation methods used in hydrological studies are reviewed. Aerial photographs present a three dimensional picture of land surface, which with properly chosen scale and good resolution provides information on geomorphological features, drainage characteristics, rock and soil types, geological structures and nature and pattern of vegetation of a wide area. Demarcation of various fluviatile environments such as flood plain, backswamp, meander belt, etc. is possible on the basis of such studies. (Knapp-USGS)

Descriptors: *Columbia River, *Discharge (Water), *Pacific Ocean, *Remote sensing, Instrumentation, Aircraft, Aerial photography, Temperature, Color, Analytical techniques, Fish, Oregon, Coasts, River flow, Winds.
Identifiers: *Infrared radiometers, *Multispectral scanner, *Upwelling, *Columbia River plume.

Infrared radiometers, photographs, and a multispectral scanner, were used in a remote sensing study of the ocean off Oregon during the summer of 1969. Upwelling appeared on infrared temperature maps as a zone of cold water along the coast and Columbia River water appeared as a warm water 'plume'. Sharp temperature and color fronts were common. The areal temperature pattern was complex and changed rapidly, undoubtedly influencing the migration and distribution of albacore tuna in Oregon waters. (Woodard-USGS)

INFRARED EXPLORATION FOR SHORELINE SPRINGS AT MONO LAKE, CALIFORNIA, TEST SITE,
Colorado School of Mines, Golden. Dept. of Geology.
Keenan Lee.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 2, p 1075-1100, 1970. 26 p, 16 fig, 1 tab, 16 ref. USGS Contract 14-08-0001-11217.

Descriptors: *Water resources development, *Remote sensing, *Surface waters, *Lakes, Shores, Springs, Aircraft, Instrumentation, Infrared radiation, Temperature, Flow rates, Streams, Radio waves, Analytical techniques.
Identifiers: *Radiometer, Bendix scanner.

Remote sensing methods offer the potential for rapid aerial exploration for water resources. This research investigated one aspect of this potential, namely the ability of a non-classified, airborne infrared scanner to detect and evaluate shoreline springs. Infrared data were collected on four different missions using the Bendix scanner. The test site contained numerous fresh water springs of various temperatures and rates of flow which discharged around and under Mono Lake. Mono Lake is a large saline lake and was therefore analogous to a marine situation. The volumetric discharge from shoreline springs at Mono Lake can be estimated from infrared imagery if air temperature at ground-level is known. Empirically derived quantitative correlation methods, derived from a study of imagery anomalies from 7 springs, estimated the discharge rates of 11 other springs using imagery data. These methods apply to small streams as well as to shoreline springs. (Woodard-USGS)

THE EFFECT OF SEA ROUGHNESS ON THE BANDWIDTH OF RADAR BACKSCATTER,
Hulburt (E.O) Center for Space Research, Washington, D.C.
Donald L. Hammond.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 2, p 797-806, 1970. 10 p, 6 fig, 2 ref.

Descriptors: *Oceanography, *Remote sensing, *Radar, Surface waters, Instrumentation, Methodology, Aircraft, Data collections, Mathematical studies, Equations, Ocean waves, Computer programs.
Identifiers: *Sea roughness, Ocean surface.

The doppler signals of an eight millim aircraft radar navigation system were analyzed to determine the effect of sea roughness on the bandwidth of the radar backscatter. The ground truth giving the wave heights were obtained by estimates made by the scientists aboard the aircraft and hindcast of the sea conditions based on weather records. The results are given in terms of a factor called 'Q' which varies inversely with bandwidth and is independent of aircraft altitude and velocity. When the data are arranged in the order of increasing wave heights, there is a trend of decreasing 'Q' with increasing wave height. (Woodard-USGS)

OCEANOGRAPHIC APPLICATIONS OF REMOTE SENSING WITH PASSIVE MICROWAVE TECHNIQUES,
Aerojet-General Corp., El Monte, Calif
A. T. Edgerton, and D. T. Trexler.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 2, p 767-788, 1970. 22 p, 16 fig, 8 ref.

Descriptors: *Oceanography, *Remote sensing, *Microwaves, *Radio waves, Methodology, Aircraft, Oceans, Pollutant identification, Water temperature, Salinity, Sea ice, Sea spray, Oil-water interfaces, Surface waters, Ocean waves.
Identifiers: *Microwave radiometry, *Sea roughness, Ocean surface.

Passive remote sensing in the microwave spectral region is a useful tool for determination of oceanographic phenomena such as sea state, pollution and sea ice characteristics. Differences in radiometric brightness temperature of the sea surface on the order of 15 deg K have been readily detected during airborne measurements of the Salton Sea, California and the North Atlantic. Oil based pollutants on the ocean surface radically affect the radiometric response because of the distinctly different dielectric properties of the oil as compared to water. Salinity variations in sea water between 30,000 and 35,000 ppm are detectable with long wavelength radiometers. Another application of microwave radiometry is the delineation of various sea ice types based on surface roughness, thermal gradient in the ice, and the presence or absence of brine pockets. THE REMOTE SENSING OF THE SEA AND SEA ICE,
Naval Research Lab., Washington, D.C.
N. W. Guinard.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 2, p 731-754, 1970. 18 p, 12 fig, 1 tab, 9 ref.

Descriptors: *Oceanography, *Remote sensing, *Data collections, *Radar, *Atlantic Ocean, Aircraft, Sea ice, Sea water, Surface waters, Ocean waves.
Identifiers: *Sea roughness, Ocean surface.

The Naval Research Laboratory has developed a unique data collection facility, the Four-Frequency Radar (4FR) System which is an experimental radar installed in an EC-121 (Super Constellation) aircraft. The system has a wavelength capability spanning the range from UHF to X band, with linear polarization diversity, pulsewidth and repetition rate flexibility and the ability to illuminate the rain and targets at various angles of incidence and with near simultaneity. This system was used to measure the radar returns scattered from both sea and ice surfaces both for the purpose of identifying sea states and ice types and to determine effective models of the scattering processes to aid in the design of optimum sensors. Data collected over the ocean in low sea states at Puerto Rico and in the higher sea states observed in the North Atlantic were used to verify the predictions of the slight rough surface model. Polar ice was mapped in synthetic aperture mode to determine roughness and contour. Some penetration effects are noted. (Woodard-USGS)
W71-08364

REMOTE SENSING OF THE SEA CONDITION WITH MICROWAVE RADIOMETER SYSTEMS,
Microwave Sensor Systems, Inc., Downey, Calif. and RCA Corp., Princeton, N.J.
J. C. Aukland, P. J. Caruso Jr., W. H. Conway, and R. G. Groshans.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 2, p 705-719, 1970. 11 p, 5 fig, 3 tab, 3 ref.

Descriptors: *Oceanography, *Remote sensing, *Instrumentation, *Data collections, Meteorology, Mathematical studies, Water temperature, Aircraft, Radio waves, Microwaves, Radiation, Atmospheric physics, Surface waters, Ocean waves.
Identifiers: *Sea roughness, Ocean surface.

Information about the condition of the sea surface is of major importance to shipping, fishing, naval operations. Likewise, other oceanographic activities and meteorological analyses and forec

quire sea surface data across the full expanse of e oceans. Two of the important parameters are state and sea-surface temperature. A crowave radiometric experimental program is cussed. The purpose of the program was to nerate curves relating sea state and sea-surface nperature to apparent radiometric temperatures, oviding the basic data to be used with remote crowave radiometric measurements for deter-ning sea state and sea-surface temperature. The ound based measurements indicate that foam and face ripple must be considered in any system asuring sea state or sea temperature. The esence of foam significantly modifies the iometric temperature by 20 - 100 deg, depend- upon the quantity of foam in the beam. The asurements further point out the need for air-ne measurements to generate curves for sea te determination. (Woodard-USGS)

ME-SPACE VARIATIONS OF THE GULF REAM AS OBSERVED BY AIRBORNE MOTE SENSING TECHNIQUES,
val Oceanographic Office, Washington, D.C.
. Wilkerson, and V. E. Noble.
ceedings 6th International Symposium on mote Sensing of Environment, Michigan Univer-, Ann Arbor, Oct 13-16, 1969, Vol 2, p 671-, 1970. 38 p, 16 fig, 2 tab, 5 ref.

scriptors: *Ocean circulation, *Ocean currents, tlantic Ocean, *Gulf of Mexico, *Tracking hniques, Remote sensing, Water temperature, craft, Bathythermographs, Data collections, thodology, Isotherms, Surface waters.
ntifiers: *Gulf streams, Time-space variations.

ring May to July 1969, 22 aerial surveys of the lf Stream were made. During the tracking mis-ns, the significant sea surface temperature front ineating Gulf Stream water from Slope Water ually defined by the surface packing of the 21 - deg C isotherms) was located with a remote sing radiation thermometer. Starting at the east st between longitudes 75 deg W and 73 deg W, boundary was tracked downstream to lon-ides between 65 deg W and 60 deg W. During iods of rapid motions of the meanders of the f Stream, some segments of the surface tem-ature front defining its position moved as much 0 km/day. Bathythermograph data showed that surface position being rracked during flight was allel to and, in general, 20-50 km shoreward of Gulf Stream position at the 200-meter depth. In region, Gulf Stream water overran Slope ter, producing very shallow layer depths usually than 20 meters. (Woodard-USGS)

ntifiers: *Condition mapping, *Crop surveys, ch elm disease, Wheat rust.

institute of remote sensing was established at th Dakota State University for Dutch elm dis-detection, wheat rust and other plant or insect s detection, land classification, moisture and ir-tion surveys. Computer-oriented data will be l for agricultural research, resource planning management. The U.S. Department of Interior support hydrologic and geologic studies. The Department of Agriculture will support crop soil investigations. A twin-engined airplane will take aerial photographs from 3,000 to 10,000 feet, which will be interpreted by specialists. NASA aircraft equipment will be used to map soil moisture, land classification, irrigation and salinity, plant stress and pollution. Fertilization and irrigation practices may be better managed by 'condition mapping' of the land resource. Four photographs show tree disease infection, aircraft instrumentation, soil types, and mosquito surveys. (Popkin-Arizona)

THE ACOUSTIC STREAMFLOW-MEASURING SYSTEM ON THE COLUMBIA RIVER AT THE DALLES, OREGON,
Geological Survey, Portland, Oreg.
Winchell Smith, Larry L. Hubbard, and Antonius Laenen.
Geological Survey Open-file Report, Jan 1971. 60 p, 32 fig, 5 tab, 10 ref.

Descriptors: *Flowmeters, *Streamflow, *Acoustics, *Columbia River, *Oregon, Methodology, Equipment, Instrumentation, Stream gages, Discharge measurement, Flow rates, Dams, Non-uniform flow.
Identifiers: *The Dalles (Oreg), *Acoustic velocity meter.

Because dams control watersurface elevations in the Columbia River from Bonneville Dam to the Canadian border, conventional stream-gaging methods, used historically, are no longer adequate. An acoustic streamflow-measuring system in the river channel at The Dalles, Oreg, provides an index of water velocity by measuring the difference in travel times of acoustic pulses transmitted through the water in each direction along a diagonal path across the river. The flow of water along the path increases the speed of one signal and retards the speed of the other. The difference in time of travel is related linearly to the water velocity along the path. The velocity index and river stage are used as a two-variable index in the computation of flow. These variables, correlated against current-meter measurements made with specialized boat equipment, provide a reliable basis for computations of instantaneous and daily mean discharges. This report covers the general theory behind acoustic velocity meters. Conclusions are that the AVM can now be considered as an operational instrument which permits accurate gaging of river discharge at many sites where conventional stream-gaging procedures have proved to be unreliable. (Woodard-USGS)

OPEN-CHANNEL INTEGRATING-TYPE FLOW METER,
Geological Survey, Albuquerque, N. Mex.
F. C. Koopman.
Geological Survey Open-file Report, Apr 1971. 25 p, 5 fig, 3 tab, 2 ref.

Descriptors: *Flowmeters, *Flow measurement, Flow rates, Instrumentation, Gages, Water measurement, Electrolysis.
Identifiers: *Flowmeters (Integrating).

A relatively inexpensive meter was developed for measuring cumulative flow in open channels with a rated control. It translates the nonlinear function of gage height to flow by use of a cam and a float. A variable resistance element in an electronic circuit is controlled by the float so that the electric current in the circuit corresponds to the flow of water. The flow of electricity causes electroplating with silver; the amount of silver deposited is proportionate to the total flow of water. A device was developed to measure the total amount of silver electrolytically. (Knapp-USGS)

PROJECT HYDRA,
John N. Spinning.
Military Engineer, Vol 63, No 412, p 82-84, Mar-Apr 1971. 3 p, 4 fig.

Descriptors: *Surveys, *Hydrography, *Telemetry, *Instrumentation, *Mapping, *Measurement, Sounding, Oceanography, Bathymetry, Profiles, Terrain analysis, Topography, Automation.
Identifiers: *Automatic survey systems.

The HYDRA Survey System was developed for use in river, harbor, and near-shore surveys. Such marine areas often present difficult survey problems because of unusual local conditions or logistic support limitations. The new system provides the user with maximum mobility, yet requires the minimum of logistic support. The HYDRA Survey System is a lightweight, portable, digital hydrographic data acquisition package suitable for temporary installation aboard a wide variety of craft without modification to either the equipment or survey platform. Thus it permits use of indigenous craft or standard survey launches. Survey data con-

sisting of electronic coordinates and water depths correlated with the time of day are recorded on magnetic tape aboard the survey vehicle. (Knapp-USGS)

WATER RESOURCES DATA FOR COLORADO, 1969: PART 2. WATER QUALITY RECORDS.
Geological Survey, Denver, Colo.

Copies of report may be obtained from District Chief, Water Resources Division, US Geological Survey, Denver Federal Center, Denver, Colorado, 80225. Geological Survey Duplicated Basic Data Report, 1971. 83 p, 1 fig.

Descriptors: *Water quality, *Hydrologic data, *Data collections, *Surface waters, *Colorado, Chemical analysis, Streams, Stream gages, Streamflow, Discharge measurement, Sediment transport, Bed load, Sediments, Particle size, Water temperature, Irrigation water, Gaging stations, Bench marks.
Identifiers: *Water quality records.

Water quality data for surface waters in Colorado for the 1969 water year are presented. Data for a few water quality stations in bordering States are also included. Water quality information is presented for chemical quality, fluvial sediment, and water temperatures. The chemical quality includes concentrations of individual dissolved constituents and certain properties or characteristics such as hardness, sodium-absorption-ratio, specific conductance, and pH. Fluvial sediment information is given for suspended-sediment discharges and concentrations and for particle size distribution of suspended sediment and bed material. Water temperature data represent once-daily observations except for stations where a continuous temperature recorder furnishes information from which daily minimums and maximums are obtained. Data collected at the irrigation network stations are used to evaluate the chemical quality of surface waters used for irrigation and the changes resulting from the drainage of irrigated lands. (Woodard-USGS)

FLOODS IN WILMINGTON QUADRANGLE, NORTHEASTERN ILLINOIS,
Geological Survey, Washington, D.C.
Howard E. Allen, and Allen W. Noehre.
For sale by US Geological Survey, Washington, DC, 20242, Price $0.75. Geological Survey Hydrologic Investigations Atlas HA-306, 1 sheet, 1971. Text, 9 fig, 1 map, 2 tab, 2 ref.

Descriptors: *Floods, *Flood plains, *Hydrologic data, *Flood control, *Illinois, Streamflow, Flow characteristics, Runoff, Discharge measurement, Stream gages, Peak discharge, Planning, Flood protection, Flood forecasting, Hydrographs.
Identifiers: *Flood measurements, Flood profiles.

This one-sheet atlas contains 12 illustrations and a text concerning hydrologic data that can be used to evaluate the extent, depth, and frequency of flooding that affect the economic development of flood plains in the Wilmington quadrangle, northeastern Illinois. It will aid individuals, government agencies, and others responsible for solving existing flood problems and for formulating effective flood plain regulations that will minimize the creation of new flood problems. The report will also be useful for preparing building and zoning regulations, locating waste disposal facilities, developing recreational areas, and managing surface water in relation to groundwater resources. The areas inundated by floods along streams in the Wilmington 7.5 minute quadrangle are delineated on a topographic map. (Woodard-USGS)
W71-08332

HYDROGEOLOGIC CHARACTERISTICS OF THE VALLEY-FILL AQUIFER IN THE ARKANSAS RIVER VALLEY, BENT COUNTY, COLORADO,
Geological Survey, Denver, Colo.
R. Theodore Hurr, and John E. Moore.
Geological Survey Open-file Report, Mar 1971. p, 4 fig, 11 ref.

Descriptors: *Hydrogeology, *Alluvium, *Surface groundwater relationships, Groundwater, Water table, Bedrock, Saturated flow, Transmissivity, Irrigation wells, Water utilization, Colorado.
Identifiers: Arkansas River valley, Bent County (Colo), Saturated thickness.

Irrigation wells in a 36-mile reach of the Arkansas River Valley in Bent County, Colo., tap a valley-fill aquifer that occurs in unconsolidated clay, silt, sand, gravel deposits. The aquifer ranges from 0 to 200 feet thick and 1 to 5 miles wide. The Arkansas River is a natural drain for the aquifer and is hydraulically connected with it. The yields of irrigation wells range from 100 gallons per minute to 2,500 gallons per minute. The transmissivity of the aquifer is as much as 40,100 square feet per day. The atlas contains maps at a scale of 1:62,500 showing saturated thickness, configuration of the bedrock, depth to water, water-table contours, and transmissivity of the valley-fill aquifer. The transmissivity map was used to construct electric analog and digital models of the Arkansas River valley. (Lang-USGS)
W71-08333

FLOODS IN HUNTLEY QUADRANGLE, NORTHEASTERN ILLINOIS,
Geological Survey, Washington, D.C.
Gerald L. Walter, and Roman T. Mycyk.
For sale by US Geological Survey, Washington, DC, 20242, Price $0.75. Geological Survey Hydrologic Investigations Atlas HA-361, 1 sheet, 1971. Text, 8 fig, 1 map, 3 tab, 2 ref.

Descriptors: *Floods, *Illinois, Maps, Profiles, Mapping, Flood forecasting, Frequency analysis, Stage-discharge relations, Data collection, Hydrologic data, Runoff.
Identifiers: Huntley (Ill).

This 1-sheet hydrologic atlas presents hydrologic data that can be used to evaluate the extent, depth, and frequency of flooding that affect the economic development of flood plains in the Huntley quadrangle, northeastern Illinois. It will aid individuals, government agencies, and others responsible for solving existing flood problems and formulating effective flood-plain regulations that will minimize the creation of new flood problems. The report will also be useful for preparing building and zoning regulations, locating waste disposal facilities, developing recreational areas, and managing surface water in relation to the groundwater resources. The approximate areas inundated by floods along streams in the Huntley quadrangle are delineated on a topographic map. Frequency of floods at the Geological Survey gaging station at Nippersink Creek near Huntley, Ill., was derived from streamflow records of this station combined with records for other nearby stations and with the regional flood-frequency relation for streams in North Illinois. Profiles of the water surface for the floods of February 1966 and June 1967 are shown. (Knapp-USGS)

FLOODS IN THE YABUCOA AREA, PUERTO RICO,
Geological Survey, Washington, D.C.
Fred K. Fields.
For sale by US Geological Survey, Washington, DC, 20242, Price $1.00. Geological Survey Hydrologic Investigations Atlas HA-382, 1 sheet, 1971. Text, 6 fig, 1 map, 1 tab.

Descriptors: *Floods, *Puerto Rico, Maps, Profiles, Mapping, Flood forecasting, Frequency analysis, Stage-discharge relations, Data collections, Hydrologic data, Runoff.
Identifiers: Yabucoa (Puerto Rico).

The lower Rio Guayanes basin is virtually unprotected from high-magnitude floods. Two such floods occurred during the period 1936-60. This 1-sheet hydrologic atlas provides factual and interpretive information to aid the planner, designer, or any other interested person to reach rational decisions related to land use in the flood plain of the lower Rio Guayanes basin. Among the data presented are stream flood profiles and the area of inundation for the September 6, 1960, flood. Major floods are known to have occurred in 1931, 1936, 1945, 1952, 1956, 1960, and 1961. The largest floods of this group are those of May 20, 1936, and September 6, 1960. Current-meter measurements of Rio Guayanes made at Highway PR-3 define the stage-discharge relation from 30 to 1,200 cfs. The U.S. Soil Conservation Service has estimated the discharge of the 1960 flood at the valley cross section along Highway PR-3 to be 40,000 cfs. The area of inundation that resulted from floodflow in the lower Rio Guayanes basin is delineated on the topographic map. (Knapp-USGS)

FLOODS IN CHANNAHON QUADRANGLE NORTHEASTERN ILLINOIS,
Geological Survey, Washington, D.C.
Howard E. Allen, and Allen W. Noehre.
For sale by US Geological Survey, Washington, DC, 20242, Price $1.00. Geological Survey Hydrologic Investigations Atlas HA-362, 1 sheet, 1971. Text, 10 fig, 1 map, 2 tab, 4 ref.

Descriptors: *Floods, *Illinois, Maps, Profiles, Mapping, Flood forecasting, Frequency analysis, Stage-discharge relations, Data collections, Hydrologic data, Runoff.
Identifiers: Channahon (Ill).

This 1-sheet hydrologic atlas presents hydrologic data that can be used to evaluate the extent, depth, and frequency of flooding that affect the economic development of flood plains in the Channahon quadrangle, northeastern Illinois. It will aid individuals, government agencies, and others responsible for solving existing flood problems and for formulating effective flood-plain regulations that will minimize the creation of new flood problems. The report will also be useful for preparing building and zoning regulations, locating waste disposal facilities, developing recreational areas, and managing surface water in relation to groundwater resources. The areas inundated by floods along streams in the Channahon 7 1/2-minute quadrangle are delineated on a topographic map. Local residents reported that the flood of July 1957 was the highest observed in the past 50 years on Jackson Creek. This flood had a 40-year recurrence interval at the Du Page River gaging station. Profiles of the water surface, based primarily on elevations of marks left by the floods of October 1954, July 1957, and May 1966 are shown. Depth of flooding at any point can be estimated by subtracting the ground elevation from the water-surface elevation at the same point, indicated by the profiles. (Knapp-USGS)

INTERNATIONAL HYDROLOGICAL DECADE YEARBOOK OF THE FEDERAL REPUBLIC OF GERMANY-CALENDAR YEAR 1967.

Federal Republic of Germany 1967 International Hydrological Decade Yearbook, Coblenz, 1970. 138 p, 72 ref.

Descriptors: *International hydrological decade, *Hydrologic data, *Data collections, *Reviews, Surface waters, Stream gages, Groundwater, Water quality, Water yield, Streamflow, Runoff, Water levels, Hydrogeology, Soil moisture, Meterological data, Sediment transport, Water temperature, Water pollution, Evaporation, Water balance.
Identifiers: *Index (Hydrologic data), *IHD Yearbook, *Federal Republic of Germany.

This International Hydrological Decade yearbook contains information concerning hydrologic data collected in the Federal Republic of Germany during 1967. The location, description, and index of data collection stations along with related information are presented for the following programs: (1) Water Stage, Discharge, Suspended Matter Load, Dissolved Load and Temperature of River Waters; (2) Chemistry and Biology of River Waters; (3) Radioactivity of River Waters; (4) Groundwater Level; (5) Soil Moisture, Evaporation and Infiltration; and (6) Meteorological Data. SURFACE WATER DATA--ATLANTIC PROVINCES, 1968.
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.

Canada Department of Energy, Mines and Resources, Inland Waters Branch Water Survey of Canada Report, 1971. 152 p.

Descriptors: *Streamflow, *Hydrologic data, *Data collections, *Stream gages, *Flow rates, Gaging stations, Flow measurement, Average flow, Low flow, Peak discharge, Discharge measurement, Runoff.
Identifiers: *Canada, Atlantic Provinces (Canada).

Streamflow data are presented for 158 sites in Newfoundland and Labrador, New Brunswick, Nova Scotia, and Prince Edward Island for the period October 1967 to December 1968. The tables of data include a description of the gaging station and daily, monthly, and yearly discharges of the stream. The description of the station gives the location, drainage area, extremes of discharge and general remarks. This report is one of a series containing hydrometric survey data for the Atlantic Provinces of Canada. (Woodard-USGS)

WATER RESOURCES OF THE RIVER ROUGE BASIN, SOUTHEASTERN MICHIGAN,
Geological Survey, Washington, DC.
R. L. Knutilla.
For sale by US Geological Survey, Washington, DC 20242 - price $1.50 per set. Geological Survey Hydrologic Investigations Atlas HA-356, 2 sheets, 1971. Text, 19 fig, 7 map, 2 tab.

Descriptors: *Water resources development, *Michigan, Streamflow, Groundwater, Water quality, Urbanization, Water pollution, Cities, Water yield, Runoff, Hydrologic data, Data collections, Maps, Surveys, Lakes.
Identifiers: *Detroit (Mich), *River Rouge (Mich).

This 2-sheet hydrologic atlas represents a part of a comprehensive study of the water resources of southeastern Michigan. Its purpose is to provide information on (1) the physical features of the River Rouge and its tributaries, (2) the characteristics of streamflow, (3) the quality of ground and surface water, and (4) the availability of the groundwater. The River Rouge basin, a triangular area of 467 square miles, is characterized by hilly or moderately undulating topography in the north and west and by relatively flat land to the southeast. Larger streams in the basin flow through well defined valleys having gradually sloping banks which are from 20 to 30 feet above the valley floor. In areas of intensive urbanization natural drainage patterns have been altered by ditches and drains constructed of storm sewers. There are 404 lakes and ponds in the basin ranging in size from less than an acre to the 670 acres in Walled Lake. The River Rouge basin lies within the Detroit Metropolitan area and, except for isolated areas, the basin has been urbanized. In much of the basin population densities are among the highest in the state. In the River Rouge basin water is relatively uniform in quality and, except for that obtained from bedrock, is chemically suitable for most municipal, agricultural and industrial supplies. Small to moderate quantities of water are available nearly everywhere in the River Rouge basin from wells completed in the glacial drift or bedrock aquifers. Wells drilled in bedrock usually yield water that is too highly mineralized for most uses. (Knapp-USGS)
W71-08535

FLOODS IN THE ANASCO AREA, PUERTO RICO,
Geological Survey, Washington, D.C.
Fred K. Fields.
For sale by US Geological Survey, Washington, DC 20242-price 75 cents. Geological Survey Hydrologic Investigations Atlas HA-375, 1 sheet, 1971. Text, 6 fig, 1 map, 2 tab.

Descriptors: *Floods, *Puerto Rico, Maps, Profiles, Mapping, Flood forecasting, Frequency analysis, Stage-discharge relations, Data collections, Hydrologic data, Runoff.
Identifiers: Anasco (Puerto Rico).

This 1-sheet hydrologic atlas provides factual and interpretive information to be used by the planner, designer, or any interested person, to reach more rational decisions related to land use in the flood plain of the lower reaches of Rio Grande de Anasco, Puerto Rico. Among the data presented are tabulations of flood stages, stream-flood profiles, and area of inundation for the flood of September 13, 1928, on Rio Grande de Anasco, and the area inundated in the vicinity of Anasco by floodwaters of Rio Daguey on August 12, 1956. Stage-frequency curves are presented from which the magnitude of future floods of selected recurrence interval can be estimated. Areas of inundation and flood profiles are specifically for valley conditions that existed at the time of the floods. The flood plain of the lower Rio Grande de Anasco has been inundated extensively at least four times during the period 1899-1967. The greatest flood known occurred August 8, 1899. The second greatest flood was that of September 13,1928. Other major floods occurred on September 26, 1932, and September 23, 1952. The peak discharge of the 1928 flood on Rio Grande de Anasco was computed as 35,000 cfs on the basis of the high-water profile and the channel geometry in the vicinity of El Espino. The inundated area was defined on the basis of flood-stage information furnished by local residents. The estimated water-surface contours for the flood of September 13, 1928, are shown on the topographic map. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS HYDROLOGIC DATA FOR ESCONDI CREEK, SAN ANTONIO RIVER BASIN, TEXA -1969,
Geological Survey, Austin, Tex.
D. R. Reddy.
Geological Survey Data Report, Feb 1971. 62 p fig, 3 tab.

Descriptors: *Streamflow, *Rainfall-runoff r tionships, *Data collections, *Hydrologic d *Texas, Small watersheds, Flow measureme Stream gages, Flow characteristics, Flow ra Hydrographs, Mass curves, Floods, Water measurement.
Identifiers: *Runoff computations, *Escond Creek (Tex), Water budget, Flood-retarding st tures.

This report, which is the ninth in a series of ba data reports published annually for the Escon Creek study area, contains the rainfall, runoff, storage data collected during the 1969 water (Oct. 1968 - Sept. 1969) for the 72.4-square- area above stream-gaging station Escondido C at Kenedy, Texas. The location of floodwate tarding structures and hydrologic instrument the area are shown. The mean annual rai (1931-60) at Karnes City is 31.93 inches. weighted-mean rainfall over the study area fo 1969 water year was 28.31 inches, or 97 perce the 15-year average of 29.06 inches. Monthly fall ranged from 0.39 inch in December to inches in April. Mean daily discharge at the str gaging station was 12.1 cfs, compared with th year average of 14.3 cfs. Annual runoff a stream-gaging station was 8,760 acre-feet, or inches. For the 1969 water year four storms selected for detailed computations. These co tations include detailed time breakdown of ra and discharge. Hydrographs and mass curve drawn for illustrations. (Woodard-USGS)

lentifiers: *Runoff computations, *Green Creek Tex), Water budget, Flood-retarding structures.

his report which is the tenth in a series of basic-ta reports published annually for the Green reek study area, contains the rainfall, runoff, and orage data collected during the 1969 water year Oct. 1968 - Sept. 1969) for the 46.1-square-mile ea above the stream-gaging station Green Creek ar Alexander, Texas. The locations of the flood-ater-retarding structures and hydrologic instru-ents in the area are shown. The weighted-mean infall was 31.01 inches, or 98 percent of the 931-60 long-term mean annual rainfall of 31.67 ches in Dublin, Texas. The mean daily discharge the stream-gaging station Green Creek near lexander was 12.7 cfs compared with the 11-year 958-69) average of 6.14 cfs. Three storm periods ere selected for detailed analysis and computa-n. These computations include detailed time eakdown of rainfall and discharge, hydrographs, d mass curves. The storms selected occurred on pril 12, 1969, May 6-7, 1969, and July 27, 1969. summary of rainfall-runoff data for these storms tabulated. Computations along the hydrographs d mass curves for the storms are shown in the mpilation and analysis of data. (Woodard-SGS)

ELECTED GROUNDWATER DATA IN THE UGENE-SPRINGFIELD AREA, SOUTHERN ILLAMETTE VALLEY, OREGON,
eological Survey, Portland, Oreg.
F. Frank, and Nyra A. Johnson.
regon State Engineer Groundwater Report No , Oct 1970. 70 p, 5 fig, 1 plate, 4 tab, 8 ref.

escriptors: *Hydrologic data, *Oregon, Hydrogeology, *Aquifers, *Water resources velopment, Groundwater, Data collections, ater wells, Aquifer characteristics, Water yield, ater quality.
entifiers: *Eugene (Oreg), *Springfield (Oreg).

he cities of Eugene and Springfield, Oregon, and eir outlying districts consistute an area where, cause of a rapidly growing population, progres-ely greater volumes of groundwater are being quired for industrial, irrigation, and public sup-es. Because of different geologic and hydrologic nditions in the area, the occurrence, quality, and ailability of groundwater vary considerably from ace to place. The most productive groundwater servoirs in the Eugene-Springfield area are re-ted to the alluvial deposits (sand and gravel) of e McKenzie and Willamette Rivers; con-quently, the high-yield wells are on or adjacent to e valley plain that is underlain by the alluvial posits. The water table in the alluvial aquifers is nerally only a few feet below land surface. Pump-g lifts are relatively small, and large-diameter ells produce moderate to large quantities of oundwater of good chemical quality. (Knapp-SGS)

ATALOG OF INFORMATION ON WATER ATA, EDITION 1970 - INDEX TO AREAL IN-ESTIGATIONS AND MISCELLANEOUS ATER DATA ACTIVITIES.
eological Survey, Washington, D. C. Office of ater Data Coordination.

vailable on application to the U.S. Geological rvey, Washington, D.C. 20242. Geological Sur-y Water Data Catalog, 1971. 178 p, 2 exhibits, 2 b.

escriptors: *Data storage and retrieval, Hydrologic data, *Data collections, *Reviews, Publications, Unites States, Documentation, eal, Surface waters, Groundwater, Water sources, Federal government, State governments, vestigations.
Identifiers: *Index, *Areal investigations, Hydrologic data aquisition, Canada.

This index, for use in retrieving water data for the U. S. contains (1) the title of each investigation, (2) the geographic area covered, (3) the inclusive dates of the investigation, (4) description of the investigation, (5) whether or not a report will be published, and (6) the reporting agency. This index, which reflects activities as of January 1, 1970, is the second edition of this section of the Catalog. The first edition was the 1968 edition. The Catalog is a file of information about water-data-acquisition activities. This file is on media suitable for data processing, supplemented by microforms and station-location maps. The information contained in the Catalog file is reported on OWDC on standard forms by Federal State, municipal agencies, and private organization that acquire water data directly in the field and laboratory. Thus, the Catalog is a file of information about water-data-acquisition activities and does not contain the actual data, which must be obtained from the reporting agencies. (Woodard-USGS)

RECONNAISSANCE OF THE BLACK RIVER, A COLD-WATER RIVER IN THE NORTH-CENTRAL PART OF MICHIGAN'S SOUTHERN PENINSULA,
Geological Survey, Washington, D.C.
G. E. Hendrickson, and C. J. Doonan.
For sale by the U.S. Geological Survey, Washington, D.C.--Price $1.25 per set. Geological Survey Hydrological Investigations Atlas HA-345, 1971. 2 sheets, Text, 3 fig, 5 map, 7 tab, 11 ref.

Descriptors: *Rivers, *Michigan, *Fishing, *Recreation, Water quality, Streamflow, Velocity, Wild rivers, Scenery, Water resources development, Maps, Hydrologic data.
Identifiers: *Black River (Mich).

The Black River north of Johannesburg in Otsego County has been rated by many fisherman as the number one brook-trout stream in the north-central part of the southern peninsula of Michigan. Headwaters are a few miles north of Johannesburg, and the Black River flows northward to join the Cheboygan River a few miles south of Cheboygan. The recreational value of a river depends on the characteristics of streamflow, water-quality, and its bed and banks. The purpose of this atlas is to describe these characteristics and to show how they relate to recreational uses. Sheet 1 of this atlas presents information on streamflow characteristics and water quality. Sheet 2 describes the physical character of the stream channel, bed and banks, and shows how it relates to streamflow, water quality, and recreational use. (Knapp-USGS)

HYDROLOGIC DATA: 1968, VOLUME 4, SAN JOAQUIN VALLEY.
California State Dept. of Water Resources, Sacramento.

Copies of report available from Office of Procurement, Documents Section, P. O. Box 20191, Sacramento, Calif. 95820-Price $4.00. California Department of Water Resources Bulletin No 130-68, October 1969. 222 p, 7 fig, 4 plate, 26 tab, 5 append.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *California, Water resources development, Data collections, Water levels, Streamflow, Water quality, Monitoring, Water wells, Aquifers, Stream gages, Climatology.
Identifiers: *San Joaquin Valley (Calif).

Report contains tables showing data on climate, surface water flow, groundwater levels, and surface and groundwater quality in the San Joaquin Valley for the 1967-68 water year. Figures show location of climatological, surface water, and surface water quality measurement stations; fluctuation of water levels in selected wells and areas; and electrical conductance at selected stations. Plates show lines of equal elevation of water in wells, spring 1968; profile of groundwater levels; cooperative study areas; groundwater level changes; and well locations. (Knapp-USGS)

THE WELL DRILLER AND THE GROUNDWATER HYDROLOGIST, COMPETITORS OR ALLIES,
R. C. Smith.
Water Well Journal, Vol 13, No 7. 3 p.

Descriptors: *Water wells, Drilling, Drilling equipment, Groundwater, Water supply, Wells.

Building and maintaining a complete underground water supply without a complete hydrological sur-

vey can be like building a complete water system without a consulting engineer or a large building without an architect. In this day of growing water demands, of increasing conflicts between users of individual demands for quantities that were almost unknown not too many years ago, groundwater is an extremely valuable resource. We must use, develop and manage our vast groundwater supplies to the fullest extent and in the most efficient manner. This is the aim of the water well contractor. It is also the aim of the groundwater hydrologist. This paper attempts to bridge the 'trust gap.' (Campbell-NWWA)

METHODS OF SETTING AND PULLING JOHNSON WELL SCREENS.
Universal Oil Products Co., St. Paul, Minn. Johnson Div.

UOP Johnson Division Bulletin No 933 (Revised Feb 1957). 16 p, 20 fig, 2 tab.

Descriptors: *Water wells, *Screens, Rotary drilling, Drilling equipment, Acid, *Well screens, Sands.
Identifiers: Cable tool drilling.

Where conditions permit its use, the simplest and best method of setting screens is called the 'standard' or pull-back method. The only requirement for this method of installation is that the casing must be of such kind and in such condition that it can be sunk down to the point where the bottom of the screen is to be set and then pulled back the length of the screen. When a screen cannot be set by the 'standard' method and the necessity arises for setting it by bailing or washing it down with open bottom, there are several other methods which may be employed, all of which center around the 'bail-down' method. The principles upon which all bailing-down processes are based is that by maintaining a constant weight on the screen and removing the sand and gravel which lies directly below the bottom of the screen, the screen will settle down by force of gravity to take the place of the material which is withdrawn. The two essentials are, therefore, provision of proper weight upon the screen, and a means whereby the material beneath the screen may either be removed or displaced so that the screen can settle down through the water-bearing formation. The various problems encountered during installation are discussed in some detail. (Campbell-NWWA)
W71-08468

GRAVEL PACKING CONTROLS UNCONSOLIDATED SAND IN VENEZUELA FIELD,
Creole Petroleum Corp., Lagunillas (Venezuela).
P. S. McReynolds.
Journal Petroleum Technology, Vol 10, No 12, p 21-24 Dec, 1958. 2 fig, 5 ref.

Descriptors: Oil industry, *Gravel, Screens, Sands, *Well casings, Casings, *Oil wells.
Identifiers: Gravel packing, Unconsolidated sand, Venezuela, Completion methods, *Sand control, *Venezuela.

Sand control has been the major problem encountered in producing oil from the unconsolitated Miocene sands in the Lagunillas area of Venezuela. One of the first completions developed to prevent excessive sand production was the combination oil string in which pre-perforated casing was employed. In most cases this method was unsuccessful in controlling sand and was replaced in 1951 by a special slotted liner completion. The slotted liner technique has been effected in controlling sand and in obtaining high volume producers in the Bachaquero sand member. However, as a satisfactory completion depends upon the ability to wash the well into production outside the liner, this technique will soon become obsolete because of the declining reservoir pressure in the Bachaquero field. A program to evaluate gravel packing as a replacement for the slotted liner technique and to provide a sand control method for use inside existing pre-perforated completions was initiated in April, 1956. Forty-three wells have been gravel packed in the Lagunillas Dist. through Sept. 25, 1957, with two jobs considered as failures. Eight wells are awaiting installation of production equipment and are expected to be satisfactory producers when opened to production. Various problems concerning fluids, liner slot sizes and loss of gravel to the formation have been encountered. Solutions to these problems have been found and procedures for both open-hole and inside gravel packs have been developed that can be applied with confidence to the sand control problems that exist in the Bolivar coastal fields. (Campbell-NWWA)
W71-08501

SAFE WAY TO CLEAR PLUGGED BITS,
Companhia de Petroleos de Angola.
F. A. M. DaSilva.
World Oil, Vol 161, No 2, p 114 and 118, Aug 1965.

Descriptors: *Drilling, *Oil industry, Drilling equipment, Drilling fluid, *Mud, Mud-water interfaces.
Identifiers: Mud densities, Annular mud velocity, Reverse mud circulation, Plugged bit.

Plugged bits are common problems in the drilling industry. Bits usually are plugged inside by cuttings, mud cake or sand. This can be caused by differences in mud densities (higher in annulus than in the drill pipe) when a connection is made. Mud flows back into the drill string and some cuttings, mud cake or sand enter through bit nozzles. After the connection is made, the pump is started, causing an abrupt increase of pressure which compacts the cuttings in the bit. Many times, it is impossible to resume circulation. A safe solution to the problem lies in progressively increasing the pressure differential at the bit. (Campbell-NWWA)
W71-08505

SPILLWAY FOR BELLEVILLE LOCKS AND DAM, OHIO RIVER, OHIO AND WEST VIRGINIA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. A. Pickering.
Available from the National Technical Information Service as AD-719 170, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-687, Aug 1965. 10 p.

Descriptors: *Dams, *Model studies, *Flow, *Test procedures, Spillways, Stilling basins, Riprap.
Identifiers: Belleville Dam.

The spillway at Belleville Dam will consist of eight 110-ft-wide bays through which flow will be regulated by tainter gates. Energy dissipation will be accomplished on a horizontal apron with baffle piers and an end sill. Model investigations were conducted on a 1:36-scale section model which reproduced one central gate bay and approximately half of each adjacent gate bay. Tests were concerned with gate sill shape, stilling basin performance, and riprap requirements downstream from the stilling basin. Tests revealed that flow conditions were satisfactory for all partial gate openings with the original design gate sill shape. The original design stilling basin resulted in high bottom velocities in the exit channel which were reduced by lowering the elevation of the basin apron. The stability of a stone protection blanket placed on a 1-on-6 slope downstream from the end sill was determined.

AUBURN DAM WILL BE THE WORLD'S LONGEST CONCRETE ARCH DAM,
Bureau of Reclamation, Denver, Colo.
B. P. Bellport.
World Dams Today, p 343-347, 1970. 5 p, 6 fig.

Descriptors: Dams, *Concrete dams, *Arch dams, Thin arch dams, Bridges (Structures), Large structure, *Double-curvature arch dams, Dam design, Dam foundations, Foundation investigations, Hydroelectric powerplants, Geologic investigations, Spillways, Environmental effects, Outlet works.
Identifiers: *Auburn Dam (Calif), Superlative, Central Valley Project, Bureau of Reclamation.

Auburn Dam will be the principal structure of the Bureau of Reclamation's Auburn-Folsom South Unit of the Central Valley Project in California. The dam will be a double-curvature, thin-arch structure, 4,000 ft long, 685 ft high, and will have a volume of 6,000,000 cu yd of concrete, a crest width of 40 ft, and a maximum base width of 200 ft. Major features of the dam, including the power plant, outlet works, spillways, elevated highway crossing on the crest of the dam, and a bridge that will cross an arm of the reservoir, are described. A feature new to Bureau of Reclamation design is a pad of concrete to be placed as an integral part of the dam throughout the profile of the damsite between the arch and abutment rock. The pad will improve the symmetry of the arches and reduce the load intensity between the arch section and abutments by distributing the pressure more uniformly on the foundation. Extensive foundation investigations and tests were made because of the size of the dam and the complexity of the geological formation at the damsite. (USBR)
W71-08622

STABILITY OF COLUMNS WITH TRANSIENT LOADS,
Illinois Univ., Urbana.
S. M. Holzer.
Proceedings, American Society of Civil Engineers, Journal of Engineering Mechanics Division, Vol 96, No EM6, p 913-930, Dec, 1970. 18 p, 4 fig, 3 tab, 9 ref, 3 append.

Descriptors: *Stability analysis, *Columns, Transient stress, *Dynamic loads, Amplification, Dynamic stability, *Structural analysis, Dynamic response, Structural stability, Loads (Forces), Structural engineering, Structural members, Differential equations, Displacements, Deflection, Motion, Analytical techniques.
Identifiers: Equations of motion, Perturbation, *Liapunov theorem.

The transverse motion of elastic columns with general end fixity subject to transient loading is described by an integro-differential equation reduced to a set of ordinary differential equations. Liapunov's direct method of the general problem of stability of motion is employed to ascertain stability directly from the differential equations of motion without knowledge of the solution. For the special case of simply supported columns, a Liapunov function is constructed, and a stability criterion is deduced from the characteristics of the function. The stability criterion constitutes a relation between a bound on the amplification of the initial perturbation and the corresponding force pulse. The relation is obtained in explicit form. Application of the stability criterion is shown for 3 sample loadings: a trigonometric pulse, a parabolic pulse, and a step pulse. The amplification bound is evaluated through comparison with the trajectory of maximum response of the governing differential equations of motion. Use of the criterion is a simple and quick method for the stability analysis of simply supported columns.

ntifiers: *Artesian aquifer, *Unconfined uifer, *Well design criteria, Sample descriptions, ell development, Pump tests, Specific yield.

thematically sound and physically correct oretical equations have been developed which sumably may be used to analyze nearly any mbination of aquifer characteristics and well sign. However, all of the equations assume a owledge of and a uniformity of conditions and an curacy of measurement which are virtually im- ssible to realize. Indeterminate errors are con- uently inevitable. Investigations or tests to minate the errors are neither physically nor nomically feasible. Nevertheless, the formulas l equations are basic to good well design. Of al importance is judgment based on experience ich permits an estimate of the influence of the letermined errors. Because of our dependence judgment, there is probably a tendency to over- ign on important well installations. It is doubtful his can ever be fully overcome, but it can be uced, and limited by further research and the hange of ideas and developments. (Campbell- WA)

WELL DESIGN CRITERIA,
Bureau of Reclamation, Denver, Colo.
T. P. Ahrens.
Water Well Journal, Vol. 11, Nos. 9 and 11, 8 p., September and November, 1957, 4 fig., 1 ref.

Descriptors: *Water wells, *Drilling, Rotary drilling, Drilling equipment, Drilling fluids, Screens, Cement, Casing.
Identifiers: *Well design criteria, Sample analyses, Selection and design of packs, Pack materials, Screen slot size, Well development.

This paper outlines some of the procedures and well design criteria developed or adopted and used by the Office of Drainage and Ground water Engineering of the Bureau of Reclamation in Denver. It deals principally with irrigation wells, but much of the criteria are applicable to domestic, industrial, and municipal water wells. The criteria generally do not apply to wells for ground water observations, ground water recharge, drainage, excavation de-watering, drilling water supply or for other temporary or special purposes. The Bureau drills wells in the 17 Western states and in some of the territories. Available drilling equipment and materials, well construction methods, and local physical conditions vary widely over this large area. The aim of well design is always the best possible well for the purpose, taking into consideration the demand, required period of sustained pumping, effective life, initial investment, operation and maintenance costs, local regulations and practices, and normal precautions on sanitary construction and aquifer contamination. Accordingly, the objective is to design the most efficient and economical well for any given aquifer and purpose. (Campbell-NWWA)

CALCULATION OF FLOWS DURING SUDDEN FLOW EXPANSION (RUSSIAN: RASCHET TECHENIY PRI VNEZAPNOM RASSHIRENII POTOKA),
Leningradskii Institut Inzhenerov Vodnogo Transporta Moscow (USSR).
A. N. Butakov.
Meteorologiya i Gidrologiya, No 11, p 70-76, Nov 1970. 3 fig, 6 ref.

Descriptors: *Flow measurement, *Model studies, *Non-uniform flow, *Channel flow, Foreign research, Turbulent flow, Reynolds number, Viscosity, Roughness (Hydraulic), Friction, Eddies, Froude number.
Identifiers: *USSR, Reflux.

An attempt is made to calculate the velocity field during sudden nonuniform expansion of flow, taking into account tangential stresses of turbulent visosity and bottom friction. A model of a sharply expanding reach consisting of an inlet channel 5 m long and 0.5 m wide and terminating in a symmetrical, sharply expanding reach 7 m long and 3 m wide is used. Depth of flow is 5.5 cm and the Reynolds and Froude numbers are 10,000 and 0.08, respectively. Kinematics of flow is studied for two bottom roughnesses: a smooth bottom and a bottom with a roughness in the form of 5-mm high staggered projections 1.5-2 cm apart. A comparison of experimental and theoretical data is made for coefficients of turbulent flow 0.04, 0.05, 0.06 and 0.08, and for a change in the friction coefficient ranging from 0.002 to 0.020. A good fit of design velocity curves with experimental curves is obtained for coefficient 0.04, irrespective of roughness, provided friction coefficients 0.0025 and 0.011 are assumed for the first and second series of experiments, respectively. Calculations performed for a suddenly expanding reach of limited width with friction coefficients 0.0000, 0.0010 and 0.0016 reveal that bottom roughness has a great effect on the length of an eddy zone and the reverse flow (reflux) rate. TRANSPORT PROCESSES OF PARTICLES IN DILUTE SUSPENSIONS IN TURBULENT WATER FLOW - PHASE I,
Illinois Univ., Urbana. Water Resources Center.
Barclay G. Jones, James A. Beoletto, Charles C. Meek, Raymond J. Ostensen, and Ronald Robin.
Available from the National Technical Information Service as PB-199 710, $3.00 in paper copy, $0.95 in microfiche. Research Report No 40, Water Resources Center, University of Illinois, Urbana, Illinois, Mar, 1971, 36 p, 14 fig, 20 ref. OWRR Project A-019-ILL (2).

Descriptors: *Water pollution sources, Flow measurements, *Dispersion, *Turbulent flow, Flow.
Identifiers: *Turbulent particulate transport, Dilute suspension, Non-Stokesian.

Modifications to an existing experimental system have been made and have been demonstrated to provide the required resolution and variable parameterization necessary for a detailed study of dilute particle suspensions in a turbulent water flow. These modifications together with the reasons for their necessity are discussed. Linearization of non-Stokesian drag has been accomplished through the introduction of a diagonal tensor into the stokes drag force equation. It was found that non-Stokesian effects tend to be of minor importance in the response of water borne particles.

Available from the National Technical Information Service as PB-199 712, $3.00 in paper copy, $0.95 in microfiche. New Jersey Water Resources Research Institute, New Brunswick, Mar 1971, 13 p, 4 fig. OWRR Project A-028-N.J. (1).

Descriptors: *Storm drains, *Hydrodynamics, Storm runoff, Fluid mechanics, Flow, Hydraulics.
Identifiers: *Urban hydrology, Storm sewers.

This completion report was a first step in a study of flow in storm sewers. A critical review of a major protion of numerous theoretical and experimental research papers on gradually varied unsteady flows has been completed. The engineering relevance of these studies to storm sewer flow dynamics is evaluated for practical applications for storm runoff in urban areas. Lateral inflow dynamics (spatially varied flow) is now under consideration and study. This will conclude the first major phase of the program, i.e., the mathematical modelling and theoretical analysis. The next step will be the analytical study and modelling of diffusional processes in combination with such types of flows in storm sewers. The two other phases of the program are: i) field work and investigation, and ii) experimental laboratory study on a simplified sewer system model and comparison of theoretical pre-

dictions with field and laboratory data. (Whipple-Rutgers)

LOCK FILLING AND EMPTYING SYSTEM, HOLT LOCK AND DAM, WARRIER RIVER, ALABAMA: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
T. E. Murphy, and J. H. Ables.
Available from the National Technical Information Service as AD-719 680, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 2-698, Nov 1965. 127 p, 70 fig, 26 tab.
Identifiers: *Dams, *Design, Drainage, Hydraulic models, Model tests, Alabama, Inland waterways, Fluid flow, Construction, *Holt Lock and Dam, *Warrior River, *Locks, Waterways, Tuscaloosa, Alabama, Spillways.

A 1:25-scale model was used to confirm the adequacy of the proposed, floor lateral culverts, filling and emptying system. A 1:15-scale model of the reverse tainter culvert valve was used to determine loads and load variations on he valve hoisting mechanism and means of reducing these loads. The adopted filling and emptying system included 12 lateral culverts with 10 ports each, centered in the lock, alternating from the two longitudinal culverts, and covering about 28 percent of the chamber length. The lock can be filled in 11 min and emptied in 12.6 min with hawser stresses not exceeding 5 tons. A split-lateral system was also investigated. However, the interlaced system is preferable for single-culvert, or nonsynchronized valve operation. Two basic designs of the reverse tainter valve were investigated. In the adopted design the skin plate was separated from the main girders by T-beams which allowed flow circulation along the upstream face of the skin plate; in the alternate design, the main structural members were inclosed in streamlined compartments.

OUTLET WORKS, COCHITI DAM RIO GRANDE, NEW MEXICO. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Thomas E. Murphy, and Don R. Bucci.
Available from the National Technical Information Service as AD-719 681, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 2-705, Nov 1965. 73 p, 49 fig, 2 tab.
Identifiers: *Dams, *Design, Hydraulic models, Fluid flow, Piers, Operation, Sand, Silt, *Cochiti Dam, *Rio Grande, New Mexico, *Outlet works, Weirs, Stilling basins.

The combination energy dissipator-irrigation diversion structure was studied in a 1:20-scale hydraulic model to verify and possibly refine the design of the primary and secondary stilling basins, determine the discharge characteristics of the weir between the two basins and each of the two diversion sluices, and investigate qualitatively the performance of the silt sluices. The performance of the energy dissipator was improved by raising the apron of the secondary basin 5 ft and modifying the position of the baffle piers in the primary basin and the size and position of the baffle piers and end sill in the secondary basin. The capacity of the irrigation diversion sluices was found to be adequate. The hydraulic performance of the silt sluices was as anticipated, but at low discharges, fine sand was removed from the model only in the immediate vicinity of the sluice intakes.

MATAGORDA SHIP CHANNEL MODEL STUDY, MATADORDA BAY, TEXAS: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Henry B. Simmons, and Henry J. Rhodes.
Available from the National Technical Information Service as AD-719685, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 2-711, Jan 1966. 215 p, 122 fig, 31 tab.
Identifiers: *Inland waterways, *Hydraulic models, *Bays, Navigation, Hydraulic models, Salinity, Alignment, Site selection, Design, Tides, Mexico Gulf, Texas, Matagorda Ship Channel model, Matagorda Bay, *Channel improvements, Jetties, Channels, Waterways, Stream flow.

A fixed-bed model of Matagorda Bay was constructed to scale ratios of 1:1000 horizontally and 1:100 vertically as an aid in developing a sound engineering design of the project, including selection of the optimum channel location, design of protective works for the channel, and determination of changes in the hydraulic and salinity regimens that would occur as a result of natural and man-made changes. Several modifications of the basic plan were tested including various lengths of jetties and dikes, with and without assumed accretions; various alignments and side slopes of the entrance channel; and several arrangements of spoil disposal banks. Tests were also conducted to determine the effects on the hydraulic and salinity regimens of the bay of changes in prototype conditions brought about by hurricane and flood conditions, and of future enlargements of the project as may be required by navigation interests.

FILLING AND EMPTYING SYSTEM CANNELTON MAIN LOCK, OHIO RIVER, AND GENERALIZED TESTS OF SIDEWALL PORT SYSTEMS FOR 110 - BY 1200-FT LOCKS HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Jackson H. Ables, and Marden B. Boyd.
Available from the National Technical Information Service as AD-719686, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 2-713, Feb 1966. 157 p, 80 fig, 34 tab, 3 ref.
Identifiers: *Dams, *Design, Fluid flow, Hydraulic models, Hydraulic systems, Shear stresses, Model tests, Pressure, Kentucky, *Cannelton Main Lock, *Ohio River, Locks, Waterways, Sidewall port systems.

The Cannelton main lock will be 110 ft wide by 1270 ft long, pintle to pintle. The hydraulic system was tested in a 1:25-scale model. Tests of 56 sidewall port arrangements resulted in the adoption of the type 45 which is composed of 25 type A ports (2.75 ft wide by 4.07 ft high at the throat) spaced 28 ft on centers in each 16- by 18-ft culvert. The original design culvert intake manifolds and culvert outlets performed satisfactorily. The adopted hydraulic system will permit the lock to be filled in about 8 min and emptied in about 9.5 min with acceptable lock chamber turbulence and hawser stresses. Following the specific tests for Cannelton main lock, generalized tests were conducted on sidewall port arrangements for 110- by1200-ft locks. Results of these tests and recommendations for sidewall port systems in locks of this size are included.

SELECTION OF OPTIMUM PLAN FOR IMPROVEMENTS IN NASSAU, NEW PROVIDENCES, BAHAMAS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Charles W. Brasfeild.
Available from the National Technical Information Service as AD-719238, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-696, Oct 1965. 26 p.

Descriptors: *Breakwaters, *Model studies, *Harbors, *Ocean waves, Ocean currents, Tides, Deep water.
Identifiers: *Harbor models, Bahama Islands, Ocean models, Test equipment, Nassau Harbor.

A 1:100-scale model of Nassau Harbor and suffi- cient offshore area to permit simulation of approaching waves was used to determine the optimum arrangement and design of certain proposed harbor improvements with respect to wave action and to determine current direction and velocities in the navigation channel and inner harbor area. The proposed harbor improvements consisted of (a) widening and deepening the entrance channel and turning basin; (b) constructing protective breakwaters at the channel entrance; (c) constructing a large artificial island in a shallow area inside the west breakwater; and (d) constructing a new pier in the inner harbor. The model was equipped with wave-generating and wave-measuring apparatus; a water-circulating system was also installed to allow simulation of steady-state tidal flows through the harbor area. It was concluded that navigation conditions would be satisfactory in the entrance channel and the inner harbor following installation of the proposed revisions, provided certain modifications were effected. Modifications recommended included lowering the crown elevation of each breakwater, installing wave absorbers at critical locations along the proposed structures, and relocating the artificial island. Appendix A presents an analysis of the prototype tides and currents in Nassau Harbor.

STABILITY OF RIPRAP AND DISCHARG CHARACTERISTICS, OVERFLOW EMBANK MENTS, ARKANSAS RIVER, ARKANSAS HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Statio Vicksburg, Miss.
N. J. Brogdon, Jr., and J. L. Grace.
Available from the National Technical Informatic Service as AD-717 873, $3.00 in paper copy, $0.9 in microfiche. WES Technical Report 2-65 Vicksburg, Miss, June 1964. 19 p, 5 tables, photos, 48 plates.

Descriptors: *Dams, *Model studies, *Emban ments, *Riprap, Shore protection, Flow, Scou Pressure, Roughness, Discharge, Arkansas.
Identifiers: Surface roughness, Arkansas River.

Hydraulic model tests were conducted on overflo embankments similar to those which will be i tegral parts of navigation dams on the Arkans River to determine the stability of various grad tions of protective stone and the discharge chara teristics of such structures. The effectiveness four gradations of riprap, with maximum sto diameters of 16, 24, and 36 in. was investigated 3- and 10-ft-high, 30- to 35-ft-wide (at crown), cess type embankments (i.e. paved roadway crown), and on 3- and 6.75-ft-high, 20- to 27.5- wide, nonaccess type embankments. The emban ment designs were furnished by the U. S. Army E gineer District, Little Rock. The tests were co ducted on a 1:4-scale section model whi reproduced 90 ft of approach channel, a 40-ft-wi section of the overflow embankment, and 140 ft exit channel. Fiber glass cloth was used to simul the gravel or crushed rock filters of the prototy In addition, a 1:12-scale section model was tes in a 1-ft-wide, glass-sided flume to determine pr sures on the crest and downstream slope of the e bankment. Observations of pressures in the zo where movement of stone was observed revea (1) instantaneous pressure fluctuations of as mu as 1.0 psi (prototype); and (2) reduced aver pressures as anticipated. Transition riprap on roadway shoulder, desirable in the interest of t fic safety, was quite easily displaced and thus considered unsatisfactory with regard to desired hydraulic performance. However, the t indicated that considerably smaller stone can used on the lower, submerged portions of downstream slope of an embankment provi such practice is warranted economically. results indicate that the combined effect of bankment height and crown width on riprap sta ty is small, that access type embankments can considered slightly more stable than nonacc types, that all stone failure occurred in the zon free flow, and that the effective or critical

ne of a particular gradation is that which presents 60 to 65 percent by weight of the total. e variation in roughness of the four gradations of ne had no liscernible effect on the discharge aracteristics of the overflow embankments thin the range of heights (3 to 10 ft) and crown dths (20 to 35 ft) investigated. The discharge aracteristics of the two types of overflow em-nkments were essentially the same. Discharge efficients applicable to the two types of embank-nts were determined for both free and sub-rged flows, and empirical equations were veloped.

ntifiers: *Wave forecasting, Wave runup.

periments on three-plane laboratory beaches w that plunging waves travel a horizontal tance of from four to eight times breaker height ing the breaking process. This suggests that the entially damaging effect of breaking waves may spread over a significant horizontal distance. e experiments, as well as previously available a, show that breaker depth-to-height ratios for nging waves decreases from above 1.3 to below as beach slope increases, so that higher waves steeper slopes may approach nearer to shore be-e breaking. The combined effect of breaker vel and breaker travel and breaker depth-to-ght ratio is such that structures sited in shallow er on moderate or steep slopes can be subject to aking wave heights significantly larger than the ign heights computed according to accepted ctice. The experimental results are consistent h a solitary wave description of oscillatory ves at breaking, if the breaker depths of oscilla-y waves are appropriately defined, and they are sistent with the limiting heights of breaking ves measured on rubble-mound breakwaters. oodard-USGS)

STEADY FREE-SURFACE FLOW COMPU-TIONS,
chigan Univ., Ann Arbor.
3. Wylie.
ceedings, American Society of Civil Engineers, rnal of the Hydraulics Division, Vol 96, No 11, p 2241-2251.

scriptors: Canals, Computer applications, draulics, Free surfaces, *Open channel flow, drology, Overland flow, *Unsteady flow, Equa-ns, Numerical analysis, Flow, Channel flow, thodology, Finite differences, River flow, Com-ation, Formulation, Momentum equation, Sub-ical flow, Continuity equation, Comparative dies, Fluid mechanics.
ntifiers: *Method of characteristics.

utions of the free-surface equations for subcriti-unsteady, one-dimensional flow by explicit and plicit formulations of the characteristics grid and tangular grid methods are analyzed. All 4 for-mulations are based on the method of characteristics. Advantages and disadvantages of each procedure are given. Examples emphasize the important features and corroborate a stability criterion that is presented. The implicit characteristics grid approach is the most accurate for overland flow situations or analysis of single channels, but is not useful for complex systems. The explicit rectangular grid is the simplest to program, but may lead to instabilities when very large time increments are used. The latter method is also comparatively expensive for long-duration transients. (USBR)

RESULTS OF FIELD INVESTIGATIONS OF VELOCITIES OF WATER MOVEMENT IN COOLING RESERVOIRS,
B. N. Gorobets.
Gidravl Gidrotekh Mezhvedom Respub Nauch-Tekh Sb, Kiev, No 3, p 132-138, 1966. Transl from Russ, Bur Reclam Transl 844, Jan 1971. 13 p, 6 fig, 8 ref.

Descriptors: Field investigations, *Thermal powerplants, Salt velocity method, Ponds, *Cooling, *Density stratification, Instrumentation, Water circulation, Turbulent flow, *Velocity distribution, Wind (Meteorology), Hydrodynamics, Model tests, Foreign research, Stratified flow, Cooling systems, Reservoirs.
Identifiers: USSR, Richardson number, Vertical temperature gradient, Temperature distribution.

Pond cooling of discharges from thermal powerplants is often used to avoid thermal pollution of streams. Knowledge of the hydrodynamics of cooling ponds and reservoirs is necessary for stable and reliable plant operation. Research to determine velocity distributions in a prototype cooling reservoir with an area of 2.5 sq km, a volume of 16 million cu m, and a depth ranging from less than 6.5 to a maximum of 17.5 m is described. Special instrumentation was developed for measuring the magnitude and direction of the reservoir currents. A complex pattern was observed, including spiral motion. Comparisons are made with velocity patterns measured in 1:50 and 1:250 scale models. The velocity pattern is caused by: (1) centrifugal inertial forces introduced by bending of the throughflow jet, (2) temperature stratification, and (3) wind action. (USBR)

BED ROUGHNESS OF A LARGE RIVER IN AN ALLUVIAL CHANNEL,
Mississippi State Univ., State College. Dept. of Civil Engineering.
Victor L. Zitta, and Melville S. Priest.
Available from the National Technical Information Service as PB-199 913, $3.00 in paper copy, $0.95 in microfiche. Mississippi Water Resources Research Institute, State College, May 1971. 15 p, 8 fig, 2 tab. OWRR Project A-049-MISS (1).

Descriptors: Rivers, River beds, *Channel flow, Boundary layers, *Open channel flow, *Roughness (Hydraulic), Mississippi River.

Data from several reaches of the lower Mississippi River, for a considerable range of discharge, are analyzed for the purpose of establishing a better understanding of the height of bed roughness and its variations along and across the stream. Data relating to the height of bed roughness in the channel, at crossings and at bends, yield to a quantitative solution. In this context, the channel is generally 'the deeper part' of the stream. Data relating to lateral variations in height of bed roughness are discussed in a qualitative manner.

USE OF RADIOISOTOPES IN TRACING RESERVOIR LEAKAGE AT ANCHOR DAM,
Bureau of Reclamation, Denver, Colo. Chemical Engineering Branch.
Robert L. Hansen, and Gerald A. Teter.
Available from the National Technical Information Service as TID25396, $3.00 in paper copy, $0.95 in microfiche. Report TID25396, July 1970. 28 p, 11 fig, 4 tab, 6 ref.

Descriptors: *Groundwater flow, Deep wells, Observation wells, Perched water table, Counters, Detectors, Injectors, Water sampling, Temperature sensors, Laboratory equipment, Gamma rays, Beta rays, Flow rates, Field tests, *Seepage losses, Tracers, *Radioisotopes, *Reservoir leakage, Tritium, Flow measurement.
Identifiers: *Anchor Dam (Wyo), Atomic Energy Commission, *Radioactive tracers, Mobile laboratories, Cavernous rock.

Radioisotope techniques and equipment were developed to trace the movement of leakage from Anchor Reservoir near Thermopolis, Wyo. Field tests were performed in the summers of 1965, 1966, and 1967. Iodine-131 as NaI was applied in the measurement of ground-water velocity using the single drill hole method. Velocity measurements were made when the reservoir was dry, and results were compared to those obtained when water was impounded behind the dam. Tritiated water was added to the reservoir leakage, and water samples were obtained from drill holes located near the reservoir for analysis of tritium content. Reservoir leakage is through a system of underground caverns which have opened to the surface predominantly at a few discrete areas on the north and northeast sides of the reservoir. Ground-water dissolved oxygen content, tritium tracer experiments, and ground-water level showed that the water cascades into a cavernous system and is carried from the reservoir area in a major escape route, with a relatively small amount being added indirectly to the normal ground-water system. Contribution to the ground-water system causes a temporary water table buildup beneath the reservoir.

FLOW IN CHUTE SPILLWAY AT FORT RANDALL DAM; HYDRAULIC PROTOTYPE TESTS,
Corps of Engineers, Vicksburg, Miss.
Carl J. Huval.
Available from the National Technical Information Service as AD-719 687, $3.00 in paper copy, $0.95 in microfiche. WES Technical report no 2-716, Apr 1966. 31 p.

Descriptors: *Dams, *Model studies, *Spillways, *Flow.
Identifiers: Fort Randall Dam.

Tests were conducted in the summers of 1960 and 1962 on the chute spillway of Fort Randall Dam to investigate the characteristics of the supercritical flow and provide data for use in future design work. Measurements were made at mean flow depths from 1.5 to 3.4 ft with average velocities from about 27 to 47 fps. This gave Reynolds numbers from about 1.3 x 10,000,000 to 6.4 x 10,000,000 and Froude numbers from 3.9 to 4.5. Two specially built pitot piers were installed in the spillway chute to measure vertical distributions. Depths of flows along the chute were measured with weighted wire gages. Water-surface depths measured on the chute spillway appeared to be close to the normal depths at the downstream end of the chute. Vertical velocity distributions on the spillway slab were in good agreement with a logarithmic equation for the supercritical flow conditions of the tests. Flow resistance was relatively high, possibly due to the concrete spillway slab joints or water-surface wave effects in the supercritical flow. Equivalent sand grain roughness values and the slope of the velocity distribution curve agree with results of previous investigations. Similar tests at other projects would be of great value, especially if data were obtained in locations on the spillways where nonuniform flow conditions occur.

Identifiers: Open-channel reaeration.

Reaeration, the physical absorption of oxygen from the atmosphere, is the primary process by which a stream replaces oxygen consumed in the biodegradation of organic wastes. This report consists of a review of the literature on methods for measuring and predicting the reaeration coefficient in open-channel flows. The tracer procedure is superior to the dissolved oxygen and disturbed equilibrium techniques for measuring the reaeration coefficient but requires the use of radioactive tracers. Theoretical models of the oxygen absorption process are not suitable for prediction of the reaeration coefficient in streams because the model parameters have not been adequately related to the bulk-flow hydraulic variables. Semi-empirical and empirical equations developed from experimental data adequately predict reaeration coefficients for streams of the type of which the equations were based but large errors may occur when the equations are applied to tother types of streams or to conditions outside the variable range considered in the original correlation. Analysis of available data indicates that there is a significant difference between reaeration coefficient regression equations based on flume data and equations based on natural stream data. A CRITIQUE OF MHD POWER GENERATION,
Avco-Everett Research Lab., Everett, Mass; and Argonne National Lab., Ill.
W. D. Jackson, M. Petrick, and J. E. Klepeis.
Transactions American Society of Mechanical Engineers, Ser A--J Eng Power, Vol 92, No 3, p 217-230, July 1970. 14 p, 22 fig, 55 ref.

Descriptors: *Magnetohydrodynamics, *Electric power production, Plasma physics, *Energy conversion, Research and development, Technology, Pilot plants, Electric generators, Economics, Environmental effects, Magnetic fields, Efficiencies, Bibliographies, Electric power, Base loads, Peak loads (Electric), Electric power demand.

Magnetohydrodynamic (MHD) electrical power generation is a technique for upgrading the efficiency of converting heat into electricity. Use of the technique in base-load plants, in addition to increasing overall efficiency, can lead to important reductions in the adverse environmental effects of thermal and air pollution. The projected efficiencies of large dual-cycle systems are initially in the range of 47-50%, and improvements in technology could increase the range to 60%. In an MHD system, energy is extracted from a flowing electrically conducting fluid of either a seeded plasma or a liquid metal. Various MHD power cycles and systems are under consideration. The status of these systems is reviewed, with emphasis on application to large central-station commercial systems. The major technological problems and progress in the 3 major cycles (open cycle, closed-cycle plasma, and closed-cycle liquid metal) are discussed. In the open-cycle system, solutions proposed for the major problems are detailed and experience is summarized. In the closed-cycle plasma system, progress made toward developing a generator with the requisite conversion efficiency is cited. Techniques leading to improved efficiencies are detailed. (USBR)

NOISE MEASURING AS A COMPLIMENTARY AND CHECKING METHOD FOR PUMP TESTING,
Budapest Technical University (Hungary).
J. J. Varga, and G. Sebestyen.
International Association of Hydraulics Research, Symp 1970. Stockholm, Sweden, 1970. 12 p, 15 fig, 8 ref.

Descriptors: *Sound, Acoustics, *Detection, Noise (Sound), Vibration, *Pumps, Test results, *Cavitation noise, Hydraulic machinery, Impellers, *Pump test, Foreign research, Research and development, Foreign tests, Reliability, Experimental data, Frequency, Accuracy, Efficiencies.
Identifiers: Hungary.

Experimental research work in correlating noise level and vibration with cavitation erosion in hydraulic pumps is reviewed. Results of the noise level measurement method developed for acoustic detection of cavitation phenomena show that the method can be very helpful in determining an opinion of the cavitational behavior of hydraulic machines. Without visual observation, the method yields more information than the hydraulic characteristics by making noise level measurements on a single properly chosen frequency. Noise level curves belonging to the characteristic curves of the pump and to the suction capacity curves determine cavitation conditions of the pump over the full delivery range. Noise level measurements increase the reliability of hydraulic measurements and give designers a basis for estimating cavitation behavior of the impeller and pump. (USBR)

ELECTRICAL DESIGN CONSIDERATIONS OF THE NELSON RIVER HVD TRANSMISSION LINE,
Teshmont Consultants, Ltd., Winnipeg (Manitoba).
M. W. Stoddart, and J. F. Graham.
Engineering Journal of Canada, Vol 53, No 10, p 44-50, Oct 1970. 7 p, 9 fig, 2 tab.

Descriptors: *Electrical design, *Transmission lines, *Direct current, Transmission (Electrical), Electric conductors, Electric coronas, *Extra high voltage, Overhead ground wire, Foreign construction, Guyed towers, Radio interference, Evaluation, Economics, Flashover, Lightning, Safety, Electrical insulators, Clearances, Bundled conductors, Overloads.
Identifiers: Canada, Transmission line hardware, Nelson River (Canada).

The Nelson River HVDC Transmission System is part of the overall plan for developing the hydroelectric potential of the Nelson River in Northern Manitoba, Canada. Two bipolar circuits are being installed initially on separate guyed towers along a common right-of-way. The line is 555 mi long with the normal rating of each line being 1620 mw at plus or minus 450 kv and 1800 amps, and an emergency rating of 3600 amps. The main electrical parameters of the transmission line are summarized. Twin 1.6-in. conductors were selected on the basis of loss evaluation and emergency overload capability. Grading rings will be provided on dead-end hardware only. Insulator strings were selected on the basis of normal working voltage. Ground clearances established for the HVDC line are consistent with accepted safety standards applied to HVAC transmission. The use of overhead ground wire shielding is expected to limit lightning flashovers to 2/yr/100 mi of line. (USBR)

CONVERSION OF HYDROELECTRIC PLANT TO REMOTE CONTROL,
North of Scotland Hydro-Electric Board, Edinburgh.
W. M. Ross, and E. G. Davidson.
Water Power, Vol 22, No 9, p 305-311, Sept 1970. 7 p, 6 fig, 1 tab.

Descriptors: Hydroelectric power, *Hydroelectric powerplants, Electric power production, Costs, *Remote control, *Automatic control, Supervisory control (Power), Foreign design practices, Communication, Telemetry, Electrical equipment.
Identifiers: Scotland, Modernizing, Communication systems, Security.

The conversion of 2 North of Scotland Hydro-Electric Board's hydroplants to remote control is described. The North of Scotland Hydro-Electric Board has 1052 mw of hydroelectric generation scattered throughout 45 stations ranging from 1 mw to 40 mw at operating heads ranging from 136 ft to 34 ft. Most plants are on semiautomatic or fully automatic control, with a few remaining on manual control. Increasing staffing costs have necessitated considering remote control for most of the small plants. Based on the total cost of conversion, the expected return on capital investment allowing for depreciation and maintenance, will be not less than 20%. Operations have been satisfactory. (USBR)

FREQUENCY CONTROL UNDER ISOLATED NETWORK CONDITIONS,
T. Stein.
Water Power, Vol 22, No 9, p 320-324, Sept 1970. 5 p, 8 fig, 2 tab, 8 ref.

Descriptors: *Load-frequency control, Interconnected systems, Damping, Time, Frequency shift, *Hydraulic turbines, *Governors, Investigation, Hydroelectric powerplants, Regulation, Fluctuation, Control, Frequency, Foreign research, Electrical stability, Hydroelectric power.
Identifiers: Austria, *Frequency response, Optimum performance, Sakingen Power Sta (West Germany).

Frequency behavior is important during a breakdown of interconnections to a grid leaving hydraulic turbines to supply an isolated network. Proving a governor setting which gives best control stability is not sufficient because a change of setting to improve stability may cause deterioration in frequency control with larger frequency overshoot. Good frequency control of an isolated network is essential because the relative local load variations are larger in relation to the total power than in an interconnected grid. Frequency deviation must not be limited only to satisfy requirements of the customers during the isolated operation, but also to permit easier return to the interconnected grid service as soon as possible. Based on measurements of the frequency response of hydraulic turbine governors with more than one input amplitude, a new concept has been tested to achieve optimum setting, considering the effect of nonlinearity of servomotor speed and the fact that large units cannot be tested on actual isolated networks. Frequency-response tests are discussed and evaluated. (USBR)

Identifiers: Test transmission lines, *Self-support- ing towers.

Results of a 6-yr investigation program of new tower designs and erection procedures for trans- mission lines are reported. The 7-mi test section of a 230-kv transmission line near Kayenta, Ariz, con- sisted of 4 towers each of 7 types, some erected by cranes and some erected by helicopter. Installed cost data are given. The 6-yr service reliability was satisfactory for the experimental section of trans- mission line. Feasibility of helicopter erection was satisfactory. Tower designs based on guyed con- struction were acceptable. Self-supporting towers were very economical. Environmentally, use of guyed towers should be avoided near substations, highways, or in agricultural fields. Basic design data of the transmission line and tower design data are given. (USBR)

ENGINEERING FUNDAMENTALS INVOLVED IN BOTTOM-HOLE-TOOL DRILLING,
Mission Mfg. Co., Houston, Tex.
J. D. Gardner.
Water Well Journal, Vol 14, No 3, Mar 1960. 5 fig.

Descriptors: *Water wells, *Drilling, Rotary drilling, Drilling equipment, Drilling fluid, Oil in- dustry.
Identifiers: *Bottom-hole-tool drilling, Cable-tool drilling, Hard-rock drilling.

A major change in the basic equipment require- ments was made when rotary drilling rigs using mud were introduced to the water well industry. Since this time only the accessory equipment was needed to add air as a drilling fluid and obtain an increase in drilling rates. With the introduction of 'Bottom- Hole-Tools,' the air compressor manufacturers have kept up with their needs. It is the purpose of this paper to present the fundamentals involved in 'Bottom-Hole-Drilling.' (Campbell-NWWA)

A CRITICAL EXAMINATION OF ROTARY DRILLING HYDRAULICS,
Texas Univ., Austin.
T. Bourgoyne, and O. K. Kimbler.
Preprint, Society of Petroleum Engineers of AIME Paper No SPE 2386, 1969. 13 p, 2 tab, 14 fig, 20 ref.

Descriptors: *Drilling, *Rotary drilling, Drilling fluids, Drilling equipment, Oil industry.
Identifiers: *Drilling hydraulics, Bit nozzle size, Maximum bit horsepower, Maximum nozzle velocity.

A new computer technique has been developed for providing information on rotary drilling hydraulics. The computer program determines the proper bit nozzle size and pump operating conditions for all combinations of depth and mud density for a given hole size. By performing the calculations for all hole sizes used, the program completely defines op- timum hydraulics for a given rig. making repetitive calculations for each well unnecessary. The com- puter program presented was used to compare vari- ous published optimization procedures over a typi- cal range of field conditions. The optimization procedures studied were (1) establishment of max- imum jet impact force, (2) establishment of max- imum bit horsepower, (3) establishment of max- imum nozzle velocity, (4) establishment of known cleaning needs with the least pump horsepower ex- penditure, and (5) establishment of optimum bit horsepower using the Economy Method. The com- parison includes differences among the procedures in pump cost as well as the differences in the hydraulic horsepower, jet impact, and nozzle velocity of the bit. (Campbell-NWWA)

WHAT TO LOOK FOR IN SELECTING AIR-DRILLING FOAMING AGENTS,
Aqua-Flo Co., Nitro, W. Va.
T. Halloran.
Oil and Gas Journal, Vol. 67, No. 23, August 8, 1966.

Descriptors: *Drilling fluids, *Rotary drilling, Drilling, Drilling equipment, Oil industry.
Identifiers: *Air-drilling foaming agents, Ap- palachian fields, Detergents, Foaming methods.

To get the most out of air drilling, operators looked for better foaming agents. Most surfactants avail- able for oil-field use in the late 1950's were by- products or detergents made for other industrial, or even household uses. These products were not ver- satile enough for the wide range of oil-field condi- tions. Many of the problems with conventional de- tergents arise from their inability to work well in other than fresh water. Brine, sulfur water, and oil cause the major difficulties. Few soaps and ordina- ry detergents can give good results in every type of fluid to which they are exposed. (Campbell-NWWA)

AUTOMATION OF SMALL RURAL WATER SUPPLY SYSTEMS (RUSSIAN: AVTO- MATIZATSIYA MALYKH SISTEM SEL'SKOK- HOZYAYSTVENNOGO VODOSNABZHENIYA),
A. I. Fabrikov, and L. S. Blagovestnyy.
Gidrotekhnika i Melioratsiya, No 1, p 84-89, January 1971. 6 p, 3 fig, 1 tab.

Descriptors: *Automation, *Water supply, *Pumps, Water delivery, Discharge (Water), Rural areas, Equipment.
Identifiers: *USSR, Water pipes.

Automation of rural water supply lines will result in significant economic gains by reducing the cost of maintenance and by increasing the discharge and smooth-flowing operation of pump units. Existing rural supply lines can be automated without great capital expense, particularly if one uses the auto- matic pressure limit switch disigned by the Southern Scientific Research Institute of Hydraulic Engineering and Reclamation. The switch is quite simple in design. Its most vital component is the diaphragm. Laboratory and production tests of various diaphragms have shown that polymer materials have great residual deformations result- ing in disturbances in the adjustment. Tests of rubber diaphragms reveal a lesser disturbance in the original adjustment. The minimum limit of level adjustment achieved to date--3 m of water column- -is considered to be satisfactory. A METHOD OF PROTECTING BANKS OF THE AMU-DARYA RIVER (RUSSIAN: SPOSOB KREPLENIYA BEREGOV REKI AMU-DAR'I),
N. I. Kryuchkov, and V. V. Mlynskiy.
Gidrotekhnika i Melioratsiya, No 1, p 44-47, Jan 1971. 4 p, 2 fig.

Descriptors: *Bank protection, *Bank stabilization, *Bank erosion, *Coastal structures, *Trenches, Coastal engineering, Erosion, Discharge (Water), Meanders, Clays, Alluvial channels, River training.
Identifiers: *USSR, Karakaplak ASSR, Amu-Darya River, Bottom erosion, Angle of repose.

The Takhiatash water engineering system on the Amu-Darya River is being built in an unstable river channel. Discharge of the river ranges from 100 to 8,000 cu m/sec. Sharp changes in the slopes of the water surface (from 0.0001 to 0.0002) produce a meandering channel on the alluvial-delta plain of the river. To protect the banks of the river it is recommended that rocks be dumped into ex- cavated trenches along the projected line of ero- sion, provided that rock interlayers or thick layers

of clay are present at the bottom limits of the erosion. By using this method river banks may be given the necessary configuration and the direction of flow may be changed at will. (Josefson-USGS)

AN EXTENSION TO THE THEORY OF THE CONSTANT HEAD IN SITU PERMEABILITY TEST,
London Univ. (England).
R. E. Gibson.
Geotechnique, Vol 20, No 2, p 193-197, June 1970. 5 p, 2 fig, 19 ref.

Descriptors: *Permeability, Permeability coefficients, Bibliographies, *Permeability tests, *In situ tests, Theory, Soil tests, Soil mechanics, Piezometers, Pore water pressure, Flow rates, Theoretical analysis, Soil investigations, Soils, Analysis, Foreign research.
Identifiers: Great Britain.

The theory of the in situ constant head permeability test (Gibson 1963) is strictly valid only if the soil behaves as a porous perfectly elastic medium. For this ideal soil, the flow rate is given by an expression which holds not only for inflow and outflow tests, but also for either a rigid or an infinitely compressible piezometer tip--a spherical cavity. The theory has been extended to take account of the anelastic behavior of real soils. The piezometer compressibility, the magnitude of the pore water pressure parameter of the surrounding soil, and the direction of flow all have an important influence on the relation between flow rate and time. (USBR)
W71-08623

GROUND MOTIONS FROM VIBRATORY ROLLER COMPACTION OF COHESIVE SOIL,
Bureau of Reclamation, Denver, Colo.
D. A. Tiedemann.
Bureau of Reclamation Report REC-OCE-70-28, June 1970. 23 p, 12 fig, 7 tab, 9 ref, append.

Descriptors: *Soil compaction, *Soil dynamics, Soil mechanics, Tamping rollers, Soil tests, Compaction equipment, Compaction tests, Test fills, Instrumentation, Rolled fills, *Vibration, *Vibratory compaction, Field tests, *Cohesive soils, Electronic equipment, Accelerometers, Effects, Acceleration (Physics), Embankments, Seismic waves, Damages.
Identifiers: Cawker City Dike (Kans) , Vibratory rollers.

A field test was conducted to obtain information concerning the compaction characteristics of a vibratory sheepsfoot roller used in constructing an embankment of cohesive soil. As a part of the test, the magnitude of ground motions produced by the vibratory roller was measured. Measurements were obtained by installing 5 triaxial sets of accelerometers in the embankment as construction progressed. Measurements were obtained over horizontal distances of 0 to 50 ft and depths ranging from about 2.0 to 22.5 ft. Results indicated that: (1) relatively high ground motions were produced in the immediate vicinity of the roller, with accelerations exceeding 1 g up to a depth and distance of 5 ft from the roller; (2) vibrations were directional, with the vertical components to the front of the roller being 2 to 3 times greater than those to the side; (3) higher ground motions were produced by the roller when stationary than when moving; (4) the magnitude of ground motions appeared to depend on the moisture content of the soil directly beneath the roller; (5) the phenomenon of beating occurred when 2 rollers were operated near each other; and (6) based on available damage criteria, the risk of damage should be considered when the roller is operated near structures. THE FACTOR OF SAFETY AGAINST UNDRAINED FAILURE OF A SLOPE,
Melbourne Univ. (Australia).
P. J. Moore.
Soils and Foundations, Vol 10, No 3, p 81-91, Sept 1970. 11 p, 9 fig, 10 ref.

Descriptors: *Slope stability, *Stability analysis, *Safety factors, Slopes, Embankments, Earth dams, Shear failure, Pore pressure, Effective stress, Shear strength, Shear stress, Soil mechanics, Equations, Foreign research, Failure (Mechanics), Slip-circle method.
Identifiers: Undrained shear strength, Friction circle method, Bishops method, Fellenius method, Australia.

Conventionally in the Fellenius, Bishop, and friction circle methods of slope stability analysis, the factor of safety is defined in terms of the failure shear stress that may be mobilized at the existing in situ value of effective normal stress. Additional pore pressure change (positive or negative) that may occur between the in situ state and the failure state when the possibility of undrained failure is being examined is not considered. The safety factor for undrained failure of a slope is redefined in terms of the shear stress on the failure plane at failure, and equations are derived for the above 3 methods of stability analysis that allow for the development of additional pore pressures. The redefinition of the factor of safety is more logical and more valid than the conventional definition. The equations are applied to the analysis of the failure of the Seven Sisters embankment in Canada. (USBR)

NONLINEAR ANALYSIS OF STRESS AND STRAIN IN SOILS,
California Univ., Berkeley; and Woodward-Clyde-Sherard and Associates, Oakland, Calif.
J. M. Duncan, and C-Y Chang.
Proceedings, American Society of Civil Engineers, Journal of Soil Mechanics and Foundations Division, Vol 96, No SM5, p 1629-1653, Sept 1970. 25 p, 19 fig, 1 tab, 27 ref, 2 append.

Descriptors: Soil investigations, *Soil mechanics, *Strain, Analytical techniques, Soil properties, *Soils, Soil tests, *Finite element method, *Stress-strain curves, *Stress, Stress analysis, Computer applications, Footings, Settlement (Structural), Bibliographies, Triaxial tests.
Identifiers: *Nonlinear properties.

The availability of high-speed computers and powerful numerical analytical techniques such as the finite element method have enabled approximating nonlinear, inelastic soil behavior in stress analysis. Nonlinear stress analyses of soils require descriptions of the stress-strain behavior of the soil in quantitative terms and techniques for incorporating the behavior in the analyses. A simple, practical stress-strain relationship representing the nonlinear, stress-dependent, inelastic stress-strain behavior of soils is described. The relationship is convenient for use with the finite element method of analysis. Values of the required parameters used in the relationship can be derived from the results of standard triaxial tests or plane strain compression tests involving primary loading, unloading, and reloading. Comparisons of calculated and measured strains in specimens of dense and loose silica sand showed that the relationship was capable of accurately representing the behavior of the sand under complex triaxial loading conditions, and analyses of the behavior of footings on sand and clay showed that finite element stress analyses conducted using the relationship agreed well with empirical observations and applicable theories.

HYDRAULIC MODEL STUDIES OF TIB DAM AUXILIARY OUTLET WORKS MISSO RI RIVER BASIN PROJECT MONTANA,
Bureau of Reclamation, Denver, Colo. Engineer and Research Center.
G. L. Beichley.
Available from the National Technical Informat Service as PB-197 834, $3.00 in paper copy, $0 in microfiche. Bureau of Reclamation report RI OCE-70-44 Oct 1970. 34 p.

Descriptors: *Earth dams, *Outlet works, *Re voirs, *Model studies, Irrigation press Drainage, Montana, Stilling basins, Slide gates.
Identifiers: *Drop inlets, *Tiber Dam, *Miss River Basin Project.

The existing canal outlet works tunnel at T Dam, Mont, is used as an intake and as the stream portion of an auxiliary outlet w designed to provide additional reservoir rel capacity. The existing 17-ft-dia horseshoe free tunnel is converted to a 15-ft 6-in.-dia pressure nel and is connected to a new 10-ft 9-in.-dia tu by a drop inlet and vertical bend. The smaller nel is equipped with a 7.25- by 9.25-ft slide and terminates in a stilling basin in the river c nel. A 1:17.53 scale model was used to develop hydraulic design of the auxiliary outlet work cluding: the drop inlet and vertical bend from existing canal outlet works tunnel, and the tr tion in the tunnel downstream from the chamber. Details of the model testing and rec mended modifications to the preliminary de prompted by the testing are presented.

the engineering sciences the study of the stability rock massifs is among the trickiest problems that e can encounter. The complexity of the problem increased by the fact that, under natural condiins, rock massifs are fissured. Because of this fisring, rock massifs are not homogeneous and otropic media. Water-flow phenomena in rock assifs are analyzed taking into account the isotropy due to fissuring. Some analytic methods e given for determining the static and dynamic tions of the water in fissured media. These flow rces can then be introduced into stability alyses. (Knapp-USGS)

Descriptors: *Drilling, *Rotary drilling, Oil industry, Drilling equipment, Rock mechanics.
Identifiers: *Drilling variables, Turbodrill, Energy considerations, Bit wear studies, Drilling chip analyses, Drilling efficiency.

The effects of drilling variable on rotary drilling rates and efficiencies have been studied by a series of laboratory drilling test. Two-cone 1.25-in. diameter bits were used to drill vertically upwards into rock samples at controlled weights and rates of rotation. Shale, sandstone and specially prepared concrete samples were used in this study. Power input to the drilling system was measured and drilling chips collected for energy -- size reduction studies. Reasonably good correlations between drilling variables and rates of penetration were found. Quantities that are difficult to evaluate include rock strength parameters and the effects of bit wear. Effects of bit size and geometry require further investigation. Analysis of the drilling chips confirmed the premise that, for rocks containing two or more mineral constituents of different strengths, a greater amount of rock breakage occurs in the weaker constituent. Drilling conditions which required greater amounts of energy produced finer drilling chips. As bit tooth wear progressed, drilling chips became finer. Efficiency of rotary drilling as a rock breakage mechanism was extremely low. Comparison was made with theoretical energy requirements and with energy requirements for size reduction by comminution methods. (Campbell-NWWA)

8F. Concrete

PLACEMENT OF CONCRETE IN MASSIVE HYDRAULIC STRUCTURES BY USING PRECAST SEPARATING ELEMENTS,
R. N. Petrashen.
Hydrotechnical Construction, No 1, p 23-27, Jan 1970. 5 p, 9 fig, 3 ref.

Descriptors: *Concrete dams, *Concrete placing, Construction, *Foreign design practices, Foreign construction, Formwork (Construction), Gravity dams, Temperature control, Cracking, Grouting, Shear forces, Hydraulic structures, Construction costs, Reliability, Construction methods, *Dam construction.
Identifiers: USSR.

Soviet engineers are using a new method of placing concrete in large hydraulic structures being built under severe climatic conditions. The method consists of systematic use of internal precast embedded forms as elements permitting the division of the structure into separate blocks. By using this method, the entire concrete-placing scheme is basically modified, converting it into a continuous process of gradual construction of the dam by layers. The method involves uninterrupted placement of concrete, beginning at the upstream side and progressing to the downstream side, by placing blocks with embedded separating elements. The distance between the elements is established so that no formation of temperature cracks occurs during cooling of the dam. The embedded elements in each higher layer are displaced toward the downstream side to form a stepped joint which can adequately transfer shearing forces from the upstream to the downstream side. Details of the construction method are discussed. (USBR)

LOWER-BOUND OPTIMAL DESIGN OF CONCRETE STRUCTURES,
Monash Univ., Clayton (Australia); and Waterloo Univ. (Ontario).
G. I. N. Rozvany, and M. Z. Cohn.
Proceedings, American Society of Civil Engineers, Journal of the Engineering Mechanics Division, Vol 96, No EM6, p 1013-1030, Dec, 1970. 18 p, 7 fig, 1 tab, 13 ref, 2 append.

Descriptors: *Limit design, *Reinforced concrete, Concrete structures, Continuous frames, Continuous beams, Design, *Optimization, Constraints, Engineering mechanics, *Optimum design, Load distribution, Axial loads, *Linear programming, Reinforcing steels, Stiffness.
Identifiers: Yielding, Concrete slabs.

A formulation of the optimal frame and slab problems is presented, in which specified serviceability and collapse criteria are satisfied in addition to the objective of minimizing the material consumption. The approach: (1) considers alternative loading conditions, (2) is based on the lower bound principle, and (3) with appropriate assumptions, leads to the solution of a linear programing problem. Examples of application to a 2-bay frame and a circular slab illustrate the approach. Possible refinements such as the consideration of axial forces and nonlinearity of the moment-steel area relation are investigated. (USBR)

PORTLAND CEMENT CONCRETE--RESEARCH, TESTING, AND PERFORMANCE,
Waterways Experiment Station, Vicksburg, Miss.
B. Mather.
Journal of Materials, Vol 5, No 4, p 832-841, Dec, 1970. 10 p.

Descriptors: *Concrete technology, Concretes, Admixtures, Performance, Aggregates, Concrete construction, Concrete tests, Nondestructive tests, Chemical properties, Abrasion resistance, Research and development, Data processing, Particle distribution, Particle size, Statistical analysis, *Portland cements, Spectroscopy, X-ray diffraction, *Reviews.
Identifiers: American Society for Test and Mat, American Concrete Inst, Portland Cement Association, Marburg Lecture.

Selected aspects of the state-of-the-art of predicting performance of portland cement concrete in service are reviewed. The role of research in evaluating the performance and guiding the development of tests is discussed. Remarkable progress has been made, but much remains to be done to provide basic and fundamental knowledge of the phenomena, the substances, and the environment of service. A better understanding of the nature and formation processes of the bonds that give concrete strength, the processes by which the bonds become broken, and the critical levels of interacting environmental factors that produce irreversible changes in concrete in service is needed. Such research results will permit the planning of experiments that will yield data to establish relations between levels of relevant properties and performance in levels of environmental influences. From such relations, performance may be predicted; from such predictions, test methods and specifications can be established. (USBR)

DETERIORATED CONCRETE IN NORTH PLATTE RIVER PROJECT SUBSTATIONS,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
L. C. Porter.

Available from the National Technical Information Service as PB-197 844, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Report REC-ERC-71-7, Jan 1971.

Descriptors: *Concretes, *Concrete testing, *Cracks, *Foundations, Deterioration, Failures, Concrete constructions, Substations, Alkali-aggregate reaction.
Identifiers: *Foundation deterioration, Aging tests, Materials, Visual inspection, Silicon dioxide, Nebraska, Wyoming, North Platte River, Concrete cores.

Inspection of several electrical substations of the Bureau of Reclamation shows concrete in various stages of deterioration from severe to slight cracking. Concrete cores obtained from visibly deteriorated foundations at Bridgeport and Sidney, Nebr, and Laramie, Wyo, show damage from a variety of causes. Bridgeport deterioration is attributed principally to fire damage. Sidney concrete is seriously deteriorated, badly cracked, and crumbly. In the absence of complete construction records, inadequate inspection and poor-quality workmanship are the suspected causes. Concrete in Laramie Substation is deteriorating from alkali-silica aggregate reaction.

8G. Materials

SELECTION OF CHEMICAL GROUT FOR MATTMARK DAM,
Massachusetts Inst. of Tech., Cambridge; and Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau and Erdgau.
H. H. Einstein, and G. Schnitter.
Proceedings, American Society of Civil Engineers, Journal of the Soil Mechanics and Foundations Division, Vol 96, No SM6, p 2007-2023, Nov 1970. 17 p, 14 fig, 17 ref, append.

Descriptors: *Chemical grouts, Dams, Hydraulic structures, *Grouting, *Grout curtains, Laboratory tests, Leaching, *Evaluation, Permeability, Soil mechanics, Viscosity, Stability, Injection, Foreign research, Soil investigations, Shrinkage, Deformation, Deterioration, Seepage control, Bibliographies, Dam foundations, Cutoffs, Overburden.
Identifiers: Gelation, Switzerland, Mattmark Dam (Switzerland).

Four chemical grouts, 2 nearly identical sodium silicates (algonite and consonda), and 2 polymers (bakelite and polythixon) underwent extensive laboratory evaluation. First, the grouts were examined with regard to viscosity--time behavior, gelation time, temperature-influence, stability, deformability, and toxic properties. Bakelite was eliminated because of rigid deformability. The second step tested grout-soil interaction: the injectability and permeability reduction of algonite and polythixon were examined in laboratory injection tests. Both grouts reduced permeability by an order of magnitude, but polythixon was eliminated because of limited injectability. Finally, long-term leaching tests on algonite were performed to investigate the effect of syneresis. Satisfactory results led to the recommendation of algonite for eventually successful application. The evaluation procedure used is generally valid for any grout selection. (USBR)

8H. Rapid Excavation

POWERFUL BOREHOLE SLURRY PASSES FIELD TESTS,
Western Co. of North America, Richardson, Tex.
A. M. Spencer, A. L. Anderson, and G. R. Dysart.
World Oil, Vol 171, No 6, Nov 1970. 3 fig, 1 tab, 8 ref.

Descriptors: *Rock mechanics, Boulders, *Water wells, Aquifer characteristics, Oil industry, Drilling, *Explosives, *Excavation, Wells.
Identifiers: Tensile failure, Random fracturing, Slurry explosives, Stimulation depth.

The most powerful commercially available explosive is used in a versatile and safe slurry form to release high energy in the wellbore. Sustained 200 bopd increases from explosive fracturing have occurred in field tests in producing oil wells. Key features of the method are wellbore loading with bagged or high viscosity explosive, and solid tamping with cement and gravel. Advantages of the system are: (1) Good explosive-to-formation contact gives maximum energy transfer, (2) High stresses near wellbore cause desirable random fracturing, (3) Concentrated explosive generates highest volume of gases for fracture extension, (4) Casing is not damaged with protective tamping, (5) Cost compares with hydraulic fracturing and (6) The method has applicability to water well development. (Campbell-NWWA)

MATERIALS HANDLING FOR TUNNELING,
Holmes and Narver, Inc., Los Angeles, Calif. Advanced Technology Div.
J. M. Duncan, M. P. Tierney, and H. V. Schneider.
Available from the National Technical Information Service as PB-197 331, $3.00 in paper copy, $0.95 in microfiche. Final Report for Office of High Speed Ground Transportation, Urban Mass Transit Administration, Oct 1970. vp.

Descriptors: *Tunnel, *Excavation, Materials, Mathematical models, Tunneling machines, Tunnel linings, Pipelines, Construction costs.
Identifiers: *Subway railways, Hydraulic conveyors, Pneumatic conveyors, Underground surveys.

At the tunnel face advance rates anticipated for the future, material handling could become the critical factor in the tunneling project. All functional elements of the tunneling process require materials to be moved by the materials handling system. The characteristics, quantities, and flow of muck, ground support materials, materials for transport system extension, personnel, and other materials and equipment which must be transported between the surface and the work zones are defined. Candidate transport modes to meet the requirements of the future are classified as continuous flow systems or unitized transport systems. Conveyors, hydraulic pipelines, and pneumatic pipelines are selected as representative of continuous flow systems. Conventional dual rail systems with locomotive drive, sidewheel drive and cable drive, siderail systems, monorail systems, hoists, and truck systems are selected for evaluation in the unitized category. These ten transport modes are described, discussed, and analyzed through computerized mathematical models representing the cost/performance relationship for each system. Integrated systems including all elements of the total materials transport system throughout its total life cycle are conceived and analyzed. Based on the results of these evaluations and analyses, areas are identified for beneficial allocation of research and development resources to advance the state of the art of materials handling for tunneling.

THE SEAFLOOR EXCAVATOR, VOLUME II,
Northrop Corp., Anaheim, Calif. Electro-Mechanical Div.
C. P. Buckley, F. S. Coxe, and O. Shev.
Available from the National Technical Information Service as AD-720 339, $3.00 in paper copy, $0.95 in microfiche. Naval Civil Engineering Laboratory Contract Report CR-71.003, Dec 1970, v.p. 66 refs.

Descriptors: *Earth-handling equipment, *Beds under water, *Hydraulic systems, *Dredging, Excavation, Hydraulic systems.
Identifiers: *Ocean bottom, Underwater vehicles, Deep submergence, Power supplies, Ballast, Data transmission systems, Underwater equipment, Environmental tests, *Seaflower excavators, *Underwater excavation, Underwater construction.

The system definition and analysis process through which a deep-ocean Seafloor Excavator developed is described. Eight concepts are initially formulated and studied, with the three most practical being further developed. A comprehensive system and cost analysis of the three selected concepts is performed to determine the single, most effective concept. The preliminary design and the design specifications for this concept are developed. The resulting design is of a wide-tracked, remotely operated submersible vehicle equipped with a revolving, extendable (jackknife) dredging arm capable of performing earthmoving excavating dredging tasks in waters as deep as 600 feet. This report is comprised of four volumes. Volume I contains the summary, Volume II contains the preliminary design and specifications, Volume III contains the concept definition and system analysis studies conducted to establish the preliminary design requirements, and Volume IV contains supporting and supplemental data developed during the course of this program. (See also W71-08867)

FECTS OF GRAVEL CLEANING ON BOT- M ORGANISMS IN THREE SOUTHEAST ASKA STREAMS,
cific Northwest Forest and Range Experiment tion, Juneau, Alaska.
lliam R. Meehan.
ogressive Fish-Culturist, Vol 33, No 2, p. 107- , Apr 1971.

scriptors: *Benthic fauna, *Stream improve- nt, *Sedimentation, *Streambeds, Inver- rates, Aquatic insects, Amphipoda, Annelids, aska, Pacific coast region.
ntifiers: *Gravel cleaning, *Sediment reduction, fer sifter, Southeast Alaska.

Sections of streambed in three southeast Alaska streams were cleaned by means of a mechanical 'riffle sifter.' Bottom fauna populations were sampled before and after gravel cleaning to determine the effect of this operation on fish food organisms. Results indicate that invertebrate populations were reduced as a result of cleaning, but that they returned to pre-treatment levels of abundance within a year after gravel cleaning.

W71-08467 04B

BOTTOM SEDIMENTS
ISOTOPE COMPOSITION OF URANIUM (U-234, U-238) IN WATERS AN BOTTOM SEDIMENTS OF LAKE BALKHASH, AND AGE OF THE LAKE (RUSSIAN IZOTOPNYY SOSTAV URANA (U-234, U-238) V VODAKH DONNYKH OSADKAKH OZ. BALKHASH I PRODOLZHITEL'NOST' SUSHCHESTVOVANIYA VODOYEMA),
W71-08368 02H

A STUDY OF THE BACTERIAL POPULATION OF BOTTOM SEDIMENTS IN THE SANTA BARBARA CHANNEL AFTER THE OIL SPILL,
W71-08784 05C

HYDROCARBON CONTENT OF SANTA BARBARA CHANNEL SEDIMENTS,
W71-08799 05C

GENERAL CHARACTERISTICS OF NEARSHORE SEDIMENTS FROM EL CAPITAN TO VENTURA, CALIFORNIA, 1969-1970.
W71-08800 05C

BOTTOM-HOLE-TOOL DRILLING
ENGINEERING FUNDAMENTALS INVOLVED IN BOTTOM-HOLE-TOOL DRILLING,
W71-08905 08C

BOUNDARIES(PROPERTY)
AN ACT RELATING TO THE ESTABLISHMENT AND IMPLEMENTATION OF PUBLICLY FINANCED EROSION CONTROL AND BEACH RESTORATION PROJECTS.
W71-08438 06E

BOWEN RATIO
A NIGHTTIME ENERGY AND MOISTURE BUDGET IN DEATH VALLEY, CALIFORNIA, IN MID-AUGUST,
W71-08480 02D

BREAKWATERS
SELECTION OF OPTIMUM PLAN FOR IMPROVEMENTS IN NASSAU, NEW PROVIDENCES, BAHAMAS. HYDRAULIC MODEL INVESTIGATION,
W71-08510 08B

BREAKER TRAVEL AND CHOICE OF DESIGN WAVE HEIGHT,
W71-08528 08B

BREEDING

BREEDING AND LARVAL SETTLEMENT OF CERTAIN INTERTIDAL INVERTEBRATES IN THE SANTA BARBARA CHANNEL FOLLOWING POLLUTION BY OIL,
W71-08785 05C

BRES
ISOTOPE COMPOSITION OF UNDERGROUND BRINES AS AN INDICATOR OF THEIR ORIGIN (RUSSIAN OB IZOTOPNOM SOSTAV PODZEMNYKH RASSOLOV KAK POKAZATELE IKH PROISKHOZHDENIYA),
W71-08367 02F

RECONDITIONING AND REUSE OF OLIVE PROCESSING BRINE,
W71-08411 05D

LL SHOALS RESERVOIR(ARK-MO)
FOOD OF LOGPERCH (PERCINA CAPRODES), AND BROOK SILVERSIDE (LABIDESTHES SICCULUS), IN A NEW AND OLD OZARK RESERVOIR,
W71-08688 05C

NKER OIL
RECOGNITION OF BUNKER OILS BY THIN-LAYER CHROMATOGRAPHY,
W71-08608 05A

NING
RICE HULL UTILIZATION,
W71-08422 05D

DMIUM SULFIDE
MEASURING ILLUMINATION WITHIN SNOW COVER WITH CADMIUM SULFIDE PHOTO RESISTORS,
W71-08849 02D

LIFORNIA
WATER QUALITY CONTROL IN CALIFORNIA A REGIONAL APPROACH,
W71-08428 06E

CALIFORNIA'S TIDELAND TRUST SHORING IT UP,
W71-08430 06E

SANTA BARBARA CHANNEL OIL LEASES,
W71-08437 06E

THE CALIFORNIA WATER PLAN,
W71-08446 06B

SEA-WATER INTRUSION BOLSA-SUNSET AREA, ORANGE COUNTY,
W71-08527 05B

AFTERMATH OF CALIFORNIA SPILL LINGERS,
W71-08767 05G

HYDROLOGIC DATA 1968, VOLUME 4, SAN JOAQUIN VALLEY.
W71-08927 07C

LIFORNIA STATE WATER PROJECT
PUBLIC ACTION REQUISITE FOR SUCCESS,
W71-08461 06B

MERAS
OIL POLLUTION DETECTION AND DISCRIMINATION BY REMOTE SENSING TECHNIQUES,
W71-08745 05A

NADA
SURFACE WATER DATA--ATLANTIC PROVINCES, 1968.
W71-08524 07C

NAL CONSTRUCTION
THE V I LENIN KARAKUM CANAL IN THE TURKMEN SSR,
W71-08645 03F

NALS
POSSIBLE EFFECTS OF A SEA-LEVEL CANAL ON THE MARINE ECOLOGY OF THE AMERICAN ISTHMIAN REGION,
W71-08763 05C

NNELTON MAIN LOCK
FILLING AND EMPTYING SYSTEM CANNELTON MAIN LOCK, OHIO RIVER, AND GENERALIZED TESTS OF SIDEWALL PORT SYSTEMS FOR 110 - BY 1200-FT LOCKS HYDRAULIC MODEL INVESTIGATION,
W71-08509 08B

NNERIES
AEROBIC TREATMENT OF LIQUID FRUIT PROCESSING WASTE,
W71-08405 05D

CANNERY WASTE TREATMENT BY TWO-STAGE AERATION PROCESSES,
W71-08406 05D

CANNERY WASTE TREATMENT BY A HIGH SOLIDS ACTIVATED SLUDGE PROCESS,
W71-08409 05D

TRICKLING FILTER TREATMENT OF FOOD CANNING WASTE WATERS,
W71-08412 05D

NOPY
TERRAIN AND COVER EFFECTS ON SNOWMELT IN A WESTERN WHITE PINE FOREST,
W71-08854 04C

RBAMATE PESTICIDES
THE HIGH RESOLUTION NMR SPECTRA OF PESTICIDES, THE CARBAMATES,
W71-08588 05A

RBON DIOXIDE
RADIOCARBON IN THE SEA,
W71-08650 05A

RBON RADIOISOTOPES
RADIOCARBON IN THE SEA,
W71-08650 05A

CARBON-14 BIOASSAY
NUTRIENT LIMITING FACTORS IN AN OLIGOTROPHIC SOUTH CAROLINA POND,
W71-08543 05C

CATTLE
RETURNS FROM BEEF ON IRRIGATED PASTURES VS. RETURNS WITH OTHER CROPS,
W71-08488 03F

CAUSTIC PEELING
PILOT PLANT EXPERIENCES OF USDA-MAGNUSON DRY CAUSTIC PEELING PROCESS,
W71-08418 05D

CEMENT
CEMENTING SMALL WELLS,
W71-08667 08A

CEMENTING
CEMENTING SMALL WELLS,
W71-08667 08A

CENSUS
A RECREATIONAL BOATING POPULATION STATISTICAL INFORMATION SYSTEM,
W71-08593 06B

CENTRAL ARID ZONE RESEARCH INSTITUTE
AGRICULTURAL DEVELOPMENT IN INDIA,
W71-08454 03F

CENTRAL ASIA
DESERTS OF ASIA,
W71-08458 03F

CENTRIFUGATION
METHODS FOR SEPARATION OF BDELLOVIBRIO FROM MIXED BACTERIAL POPULATION BY FILTRATION THROUGH MILLIPORE FILTERS OR BY GRADIENT DIFFERENTIAL CENTRIFUGATION,
W71-08729 05A

CESIUM
PECULIARITIES IN THE GEOCHEMISTRY OF CESIUM IN GROUNDWATER OF VARIOUS DEEP ZONES OF THE EARTH'S CRUST (RUSSIAN OSOBENNOSTI GEOKHIMII TSEZIYA V PODZEMNYKH VODAKH RAZLICHNYKH GLUBINNYKH ZON ZEMNOY KORY),
W71-08537 02K

LITHIUM, RUBIDIUM AND CESIUM ABUNDANCE IN WATERS AND SOLID EJECTAMENTA OF MUD VOLCANOES OF THE KERCH-TAMAN REGION (RUSSIAN RASPROSTRANENIYE LITIYA, RUBIDIYA I TSEZIYA V VODAKH I TVERDYKH VYBROSAKH GRYAZEVYKH VULKANOV KERCHENSKO-TAMANSKOY OBLASTI),
W71-08540 02K

CHANNEL FLOW
CALCULATION OF FLOWS DURING SUDDEN FLOW EXPANSION (RUSSIAN RASCHET TECHENIY PRI VNEZAPNOM RASSHIRENII POTOKA),
W71-08371 08B

BED ROUGHNESS OF A LARGE RIVER IN AN ALLUVIAL CHANNEL,
W71-08662 08B

CHANNEL IMPROVEMENTS
MATAGORDA SHIP CHANNEL MODEL STUDY, MATAGORDA BAY, TEXAS HYDRAULIC MODEL INVESTIGATION,
W71-08508 08B

CHANNEL MORPHOLOGY
STUDY OF THE RELATIONSHIP OF A RUNOFF COEFFICIENT TO HYDROGRAPHIC CHARACTERISTICS OF A RIVER AND LAG TIME OF A FLOOD WAVE (RUSSIAN ISSLEDOVANIYE ZAVISIMOSTI KOEFFITSIENTA OTTOKA OT GIDROGRAFICHESKIKH KHARAKTERISTIK REKI I VREMENI DOBEGANIYA PAVODOCHNOY VOLNY),
W71-08383 04A

CHEMCONTROL
THE EFFECTS OF ANTITRANSPIRANT CHEMICALS ON THE TRANSPIRATION AND PHYSIOLOGY OF TAMARIX SPECIES,
W71-08469 02D

MARINE FOULING IN POWER STATIONS,
W71-08598 05D

MUSSEL FOULING IN CHLORINATED COOLING SYSTEMS,
W71-08599 05D

CHEMICAL ANALYSIS
REACTIONS OF A STRONGLY BASIC ION EXCHANGE RESIN WITH DILUTE AQUEOUS SOLUTIONS IN A COLUMNAR SYSTEM,
W71-08391 05D

WATER QUALITY STUDY OF THE POPLAR RIVER, DOUGLAS COUNTY, WISCONSIN - TRIBUTARY TO LAKE SUPERIOR,
W71-08495 05B

CHEMICAL ANALYSES OF SOME VASCULAR AQUATIC PLANTS,
W71-08691 05C

CHEMICAL GROUTS
SELECTION OF CHEMICAL GROUT FOR MATTMARK DAM,
W71-08639 08G

CHEMICAL OXYGEN DEMAND
RECONDITIONING AND REUSE OF OLIVE PROCESSING BRINE,
W71-08411 05D

WATER QUALITY STUDY OF THE POPLAR RIVER, DOUGLAS COUNTY, WISCONSIN - TRIBUTARY TO LAKE SUPERIOR,
W71-08495 05B

CHEMICAL PRECIPITATION
COMBINED BIOLOGICAL AND CHEMICAL TREATMENT FOR PHOSPHORUS REMOVAL,
W71-08828 05D

CHEMICAL SHIFTS
THE ENHANCEMENT OF ASYMMETRY EFFECTS IN NMR BY INTERMOLECULAR HYDROGEN BONDING,
W71-08834 05A

EU(DPM)3 TRANSANNULARLY INDUCED PARAMAGNETIC CHEMICAL SHIFTS IN THE PMR SPECTRA OF ENDRIN, DIELDRIN, AND PHOTODIELDRIN,
W71-08835 05A

LONG-RANGE COUPLINGS IN THE CHLORINATED POLYCYCLODIENE PESTICIDES,
W71-08836 05A

CHEMICAL WASTES
MERCURY CONTENT OF VARIOUS BOTTOM SEDIMENTS, SEWAGE TREATMENT PLANT EFFLUENTS AND WATER SUPPLIES IN WISCONSIN (A PRELIMINARY REPORT),
W71-08609 05B

WASTE WATER CONTROL FACILITIES IN A PETROCHEMICAL PLANT,
W71-08676 05D

THE SANITATION SITUATION OF THE MARINE COASTAL WATERS OF NORTH SARDINIA IN RELATION TO INDUSTRIAL POLLUTION AND URBAN SEWAGE, (SITUAZIONE IGIENCIA DELLE A CQUE MARINE COSTIERE DEL NORD-SARDEGNA IN RAPPORTO ALL' INGUINAMENTO INDUSTRIALE E FOGNARIO-URBANO),
W71-08723 05B

CHERNOZEMS
WATER REGIME OF MOUNTAIN CHERNOZEMS OF THE KARACHAYEVO-CHERKESSKAYA AUTONOMOUS REGION (RUSSIAN VODNYY REZHIM GORNYKH CHERNOZEMOV KARACHAYEVO-CHERKESII),
W71-08369 02G

CHESTER COUNTY(PENN)
FLOOD PLAIN INFORMATION-WEST BRANCH BRANDYWINE CREEK.
W71-08911 04A

CHICAGO(ILL)
EXPERIENCES WITH AUTOMATION IN REMOTE SAMPLING AND ANALYSIS OF SURFACE WATERS,
W71-08556 05A

W71-08939 02E

FLORIDA
HYDROBIOLOGICAL CHARACTERISTICS OF SHARK RIVER ESTUARY, EVERGLADES NATIONAL PARK, FLORIDA,
W71-08329 02L

AN ACT RELATING TO THE ESTABLISHMENT AND IMPLEMENTATION OF PUBLICLY FINANCED EROSION CONTROL AND BEACH RESTORATION PROJECTS.
W71-08438 06E

AN ACT TO PROVIDE THAT A RIPARIAN OWNER SHALL CONSENT BEFORE DREDGING MAY BE DONE FOR A PUBLIC PURPOSE.
W71-08439 06E

AN ACT ESTABLISHING THE FLORIDA ENVIRONMENTAL INVENTORY COUNCIL.
W71-08440 06E

THE FLORIDA WATER POLLUTION CONTROL AND SEWAGE TREATMENT PLANT GRANT ACT OF 1970.
W71-08441 06E

FLORIDA AQUATIC WEED CONTROL ACT.
W71-08502 06E

ACCRETION AND RECLAMATION.
W71-08596 06E

FLOW
A METHOD FOR FORECASTING MAXIMUM DISCHARGES OF WATER FLOW INTO THE KIEV RESERVOIR (RUSSIAN METOD PROGNOZA MAKSIMAL'NYKH RASKHODOV PRITOKA VODY V KIYEVSKOYE VODOKHRANILISHCHE),
W71-08376 04A

SPILLWAY FOR BELLEVILLE LOCKS AND DAM, OHIO RIVER, OHIO AND WEST VIRGINIA. HYDRAULIC MODEL INVESTIGATION,
W71-08512 08A

SEEPAGE FACE EFFECTS IN UNSTEADY GROUND-WATER FLOW,
W71-08660 02F

FLOW IN CHUTE SPILLWAY AT FORT RANDALL DAM HYDRAULIC PROTOTYPE TESTS,
W71-08865 08B

FLOW AROUND CYLINDERS
EDDY FORMATION BEHIND CIRCULAR CYLINDERS,
W71-08910 02E

FLOW AROUND OBJECTS
EDDY FORMATION BEHIND CIRCULAR CYLINDERS,
W71-08910 02E

FLOW CONTROL
THE FEASIBILITY OF OIL COLLECTION DEVICES,
W71-08747 05G

FLOW MEASUREMENT
CALCULATION OF FLOWS DURING SUDDEN FLOW EXPANSION (RUSSIAN RASCHET TECHENIY PRI VNEZAPNOM RASSHIRENII POTOKA),
W71-08371 08B

OPEN-CHANNEL INTEGRATING-TYPE FLOW METER,
W71-08525 07B

FLOW MEASUREMENTS
SEAWATER INTRUSION IN STRATIFIED ESTUARIES,
W71-08760 02L

FLOW RATES
RATES OF MELT WATER FLOW ALONG SLOPES (RUSSIAN O SKOROSTYAKH STEKANIYA TALOY VODY PO SKLONAM),
W71-08380 04A

SURFACE WATER DATA--ATLANTIC PROVINCES, 1968.
W71-08524 07C

INVESTIGATION OF THE USE OF A BORTEX FLOW TO SEPARATE OIL FROM AN OIL-WATER MIXTURE,
W71-08749 05G

FLOWMETERS
A DEVICE FOR MEASURING RUNOFF FROM CROP ROTATION FIELDS (RUSSIAN USTROYSTVO DLYA IZMERENIYA STOKA VODY NA POLYAKH SEVOOBOROTA),
W71-08387 04A

THE ACOUSTIC STREAMFLOW-MEASURING SYSTEM ON THE COLUMBIA RIVER AT THE DALLES, OREGON,
W71-08522 07B

OPEN-CHANNEL INTEGRATING-TYPE FLOW METER,
W71-08525 07B

FLOWMETERS(INTEGRATING)
OPEN-CHANNEL INTEGRATING-TYPE FLOW METER,
W71-08525 07B

FLUORESCENCE
TRANSPORT AND DISPERSION OF FLUORESCENT TRACER PARTICLES FOR THE FLAT-BED CONDITION, RIO GRANDE CONVEYANCE CHANNEL, NEAR BERNARDO, NEW MEXICO,
W71-08328 02J

FLUORESCENT TRACERS
A SYSTEM FOR DETECTING FLUORESCENT TRACERS IN STREAMFLOW,
W71-08940 07A

FOAM
POTENTIAL TOXICITY OF KRAFT MILL EFFLUENT AFTER OCEANIC DISCHARGE,
W71-08620 05C

FOAMING
TREATMENT OF AQUEOUS AGRICULTURAL WASTES FOR CLEAN WATER AND FOR MICROBIAL PROTEIN PRODUCTION,
W71-08661 05D

FOOD CHAIN
DISTRIBUTION OF SELECTED METALS IN BOTTOM SEDIMENTS,
W71-08497 05B

FOOD CHAINS
TRANSFER OF TOXIC ALGAL SUBSTANCES IN MARINE GOOD CHAINS,
W71-08597 05C

PRESENCE OF POLYNUCLEAR AROMATIC HYDROCARBONS IN COASTAL WATERS AND THE POSSIBLE HEALTH CONSEQUENCES,
W71-08727 05C

AQUACULTURAL DEVELOPMENT AND PUBLIC HEALTH,
W71-08728 05C

FOOD HABITS
FOOD OF LOGPERCH (PERCINA CAPRODES), AND BROOK SILVERSIDE (LABIDESTHES SICCULUS), IN A NEW AND OLD OZARK RESERVOIR,
W71-08688 05C

FOOD PROCESSING WASTES
FIRST NATIONAL SYMPOSIUM ON FOOD PROCESSING WASTES PROCEEDINGS.
W71-08398 05D

STATUS OF R AND D EFFORTS ON FOOD PROCESSING WASTES,
W71-08400 05D

FOOD PROCESSING WASTE TREATMENT BY SURFACE FILTRATION,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association Research Foundation.

SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
OCT 7 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 4, NUMBER 17
SEPTEMBER 1, 1971

W71-08942 -- W71-09464

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 17
SEPTEMBER 1, 1971

W71-08942 -- W71-09464

se of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

02. WATER CYCLE

2A. General

RAINFALL-RUNOFF-HYDROGRAPH RELATIONS FOR NORTHERN LOUISIANA,
Geological Survey, Baton Rouge, La.
V. B. Sauer.
Louisiana Department of Public Works Technical Report No 3, 1970. 33 p, 8 fig, 4 tab, 29 ref.

Descriptors: *Rainfall-runoff relationships, *Louisiana, *Streamflow forecasting, *Base flow, *Surface runoff, *Structural design, River flow, Regulated flow, Natural flow, Discharge measurement, Gaging stations, Water measurement, Rainfall disposition, Rain gages, Rainfall intensity, Runoff forecasting, Hydrologic data, Data collections, Meteorological data, Climatic data, Unit hydrographs, Hydrograph analysis, River forecasting, Storm runoff, Precipitation excess.
Identifiers: *Ouachita River (La), *Red River (La), *Louisiana Coastal Plain.

Streamflow records from 22 gaging stations and more than 90 rain gages were used to study the relation between rainfall, rainfall excess, and runoff hydrographs in northern Louisiana. Unit hydrographs were developed from the streamflow records and regionalized for use at any site in the study area. The regionalized dimensionless unit hydrograph can be converted to a specific unit hydrograph for a site from known values of drainage basin size and length and an estimated value of lag time. Basin lag time, a critical factor, is related to basin characteristics and, inversely, to total volume of rainfall excess for a given storm. The accuracy of the lag time and unit-hydrograph relations is fairly good if the true amount of rainfall excess is known. A random test indicated a standard error of estimate of 22 percent. (Glasby-USGS)

STUDY OF THE RELATIONSHIP BETWEEN ANNUAL RUNOFF OF RIVERS OF THE USSR AND ATMOSPHERIC CIRCULATION (RUSSIAN: ISSLEDOVANIYE ZAVISIMOSTI GODOVOGO STOKA REK SSSR OT ATMOSFERNOY TSIRKULYATSII),
A. A. Aniskina.
In: Problems in Hydrological Forecasting (Voprosy gidrologicheskikh prognozov), Gosudarstvennyy ordena Trudovogo Znameni Gidrologicheskiy Institut Trudy, No 179; Gidrometeoizdat, Leningrad, p 63-98, 1970. 36 p, 8 fig, 3 tab, 20 ref.

Descriptors: *Hydrologic cycle, *Rivers, *Runoff, Air circulation, *Moisture content, River basins, Precipitation (Atmospheric), River forecasting, Meteorological data, Distribution patterns, Synoptic analysis, Cyclones, Anticyclones.
Identifiers: *USSR, European USSR, Western Siberia, Synoptic processes.

Long-term fluctuations in the water content of lowland rivers of the USSR are dependent upon fluctuations in atmospheric circulation expressed as an alternating occurrence of one or two of the three types of atmospheric circulation--western, meridional, and eastern. Annual runoff data are given for 31 rivers of the European USSR with basin areas ranging in size from 3,780 to 48,300 sq km and for 39 rivers in the Asiatic part of the Soviet Union, several of which have basin areas over 100,000 sq km. To determine the character of the relationship of water content to different types of atmospheric circulation, a study was made of the distribution of cyclone and anticyclone activity and of precipitation anomalies peculiar to each circulation type. Fluctuations in the water content of rivers of several geographical regions for the period 1921-1962 are related to fluctuations in the recurrence of any two types of circulation. In some regions correlation indices of the relationship are 0.65-0.70. In predicting atmospheric circulation the relationships of water content to the three circulation types can be used as a basis for preparing long-term forecasts for USSR rivers. (Josefson-USGS)
W71-09136

A STUDY OF PRECIPITATION, STREAMFLOW, AND WATER USAGE ON THE UPPER RIO GRANDE,
Environmental Science Services Admin., El Paso, Tex.; and Bureau of Reclamation, El Paso, Tex.
Elden V. Jetton, and James W. Kirby.
Texas University Atmospheric Science Group Report No 25, June 1970. 203 p, 45 fig, 31 tab, 43 ref, append.

Descriptors: *Rainfall-runoff relationships, *Water balance, *Rio Grande, *Colorado, *New Mexico, Evapotranspiration, Irrigation water, Phreatophytes, Streamflow, Hydrologic budget, Climatology, Droughts, Water supply, Water yield, Water utilization, Consumptive use, Water allocation (Policy).
Identifiers: Upper Rio Grande Basin.

The upper Rio Grande watershed is one of the oldest inhabited, oldest irrigated, and fastest growing sections of the United States. The water resources of the basin may be overcommitted under the present form of usage. Drought during the late 1940's and the 1950's caused disastrous reductions in streamflow. Water delivered to New Mexico and Texas declined much more than did the annual rainfall over the Rio Grande Basin in Colorado or the streamflow upstream of areas of significant diversions and use. Part of the cline in surface water production may be attributable to small conservation tanks and other water-retarding developments. The loss of water in the Middle Section to nonbeneficial evapotranspiration is estimated at over one-half million acre-feet. Deliveries under the Rio Grande Compact have not closely reflected climatological or hydrological conditions. The economic effects caused by the reduction of water in the lower reaches of the basin have been very severe. The principal cause seems to be stream depletions in Colorado. (Knapp-USGS)

CARBON MONOXIDE IN RAINWATER,
Naval Research Lab., Washington, D.C.
J. W. Swinnerton, R. A. Lamontagne, and V. J. Linnenbom.
Science, Vol 172, No 3986, p 943-945, May 28, 1971. 3 p, 1 tab, 11 ref.

Descriptors: *Gases, *Air environment, *Precipitation (Atmospheric), *Rain water, Atlantic Ocean, Pacific Ocean, Hawaii, Carbon dioxide, Methane, Organic matter, Vapor pressure, Pollutants.
Identifiers: *Geochemical cycle, *Carbon monoxide.

To help specify the various sources and sinks which play essential roles in the geochemical cycle involving carbon monoxide in the atmosphere, rainwater and air samples were collected for analysis at three locations--in Washington, D.C., over the Pacific Ocean, and on the island of Hawaii. Concentrations of carbon monoxide in rainwater collected at these widely diverse locations show up to 200-fold supersaturation relative to the partial pressure of the atmospheric gas. These results indicate existence of an additional natural source of carbon monoxide, probably the oceans, not heretofore considered. Production of this gas in clouds is tentatively attributed to photochemical oxidation of organic matter or the slight dissociation of carbon dioxide induced by electrical discharges, or both. Methane concentrations measured in the same rainwater show that partitioning of this gas, unlike that of carbon monoxide, is very close to a state of equilibrium. (Lang-USGS)

NUMBER AND SPACING OF RAINFALL-GAUGES IN A DECIDUOUS FOREST STAND,
Wroclaw Univ. (Poland). Inst. of Botany; and Polish Academy of Sciences, Bialystok. Mammals Research Inst.
Maciej S. Czarnowski, and Jerzy L. Olszewski.
Oikos, Vol 21, No 1, p 48-51, 1970. 4 p, 2 fig, 2 tab, 8 ref.

Descriptors: *Rain gages, *Forests, *Network design, *Data collections, *Instrumentation, Hydrologic data, Meteorological data, Regional analysis, Stations, Gaging stations, Rainfall.
Identifiers: *Poland.

The representative number of rainfall-gages for measuring rainfall under a forest canopy and the best spacing of these gages were determined. The experiment was made in 1963 in a deciduous stand in Bialowieza Primeval Forest (Poland). It is desirable to use at least 30 rainfall-gages, and measurement of rainfall does not, practically speaking, depend on the spacing of these gages when they are arranged in a regular network. LONG-RANGE FORECASTING OF ICE BREAKUP ON RIVERS OF THE SEVERNYY KRAY (RUSSIAN: VSKRITIYE REK SEVERNOGO KRAYA I METODIKA YEGO DOLGOSROCHNOGO PROGNOZA),
T. N. Makarevich, N. A. Aniskina, Z. A. Yefimova, O. N. Potapova, and L. K. Savina.
In: Problems in Hydrological Forecasting (Voprosy gidrologicheskikh prognozov), Gosudarstvennyy Ordena Trudovogo Znameni Gidrologicheskiy Institut Trudy, No 179; Gidrometeoizdat, Leningrad, p 3-62, 1970. 60 p, 13 fig, 12 tab, 23 ref, 2 append.

Descriptors: *Ice breakup, *Forecasting, *Rivers, *Climatic data, Synoptic analysis, Air temperature, Water temperature, Air circulation, Meteorology, Seasonal, Heat balance.
Identifiers: *USSR, Severnyy Kray, Debacle, Ice cover.

A long-range forecast of ice breakup on rivers of the Severnyy Kray is based on analyzing the peculiarities of the spring regime of rivers and the character of the atmospheric processes which determine them. Breakup periods for rivers flowing in a northern direction are determined by the time of start and the discharge of spring high water at the upper reaches of the rivers. Ice breakup on rivers of the Severnyy Kray occurs in the period between April 20-30 and May 20-30, and generally lasts 35-40 days. Air pressure anomalies, October-March, March air temperatures in the Atlantic-European synoptic region, the Barents Sea temperature in March, and air temperatures at local stations during the last ten days of March are descriptive of the predominant macroprocesses responsible for ice breakup on rivers. The quantitative relationships derived satisfy requirements set forth by current forecasting instructions. (Josefson-USGS)
W71-09126

CALCULATING MAXIMUM ICE JAM LEVELS OF THE NEVA RIVER (RUSSIAN: RASCHET MAKSIMAL'NYKH ZAZHORNYKH UROVNEY R. NEVY),
R. A. Nezhikhovskiy, and G. V. Ardasheva.
In: Problems in Hydrological Forecasting (Voprosy gidrologicheskikh prognozov, Gosudarstvennyy Ordena Trudovogo Znameni Gidrologicheskiy Institut Trudy, No 179; Gidrometeoizdat, Leningrad, p 164-169, 1970. 6 p, 2 fig, 1 tab, 4 ref.

Descriptors: *Ice jams, *Rivers, *Water level fluctuations, *Flow profiles, Discharge (Water), Air temperature, Probability, Statistical methods, Forecasting.
Identifiers: *USSR, Lake Ladoga, Neva River.

The formation of ice jams on the Neva River depends upon water content of the river during freezing, amount of incoming ice from Lake Ladoga, and air temperature rate. Longitudinal profiles of the water surface are used to analyze fluctuations in the water level during ice jams. To calculate maximum ice jam levels of varying recurrence, empirical probability curves are constructed for a number of points at which long-term observations have been conducted (60-80 years). Probability curves of maximum ice jam levels are extrapolated into the region of rare recurrence. Graphs are constructed showing the change in equivalent values of maximum ice jam levels by river length (P—0.1; 1; 5; 20; 50%). The method used to compute maximum ice jam levels for the length of the Neva River can also be used for other rivers when ample observation points are available. (Josefson-USGS)
W71-09130

PERENNIAL ICE AND SNOW MASSES--A GUIDE FOR COMPILATION AND ASSEMBLAGE OF DATA FOR A WORLD INVENTORY.

UNESCO--IASH Contribution to International Hydrological Decade: UNESCO Technical Papers in Hydrology, No 1, 1970. 59 p, 26 fig, 9 tab, 5 ref.

Descriptors: *Snow surveys, *Glaciers, *Ice, *Data collections, *International Hydrological Decade, *Permafrost, Water yield, Regimen, Water resources development, Water resources, Runoff, Melt water, Standards, Stations, Snowpacks, Antarctic, Water balance, Heat balance, Snowmelt.
Identifiers: *Glacier surveys, *Snow and ice inventory.

Since about 80 percent of all fresh water exists in solid form, an accurate assessment of the amount, distribution and variation of all snow masses, both near and far from areas at present inhabited is of importance for the understanding of man's environment. To comply with the need for more complete and detailed informtion on ice and snow, the Co-ordinating Council of the IHD at its first session passed a resolution recommending to Member States the mapping and inventory of permanent snow and ice masses and the compilation and assemblage of data for publication in order to obtain the elements necessary for the establishment of the regional distribution of permanent and seasonal snow, permafrost and ice. Guidance and inventory methods are given for the compilation of a world inventory of perennial and seasonal ice and snow masses as a contribution to the estimation of the world water balance. (Knapp-USGS)

2D. Evaporation and Transpiration

ESTIMATING EVAPOTRANSPIRATION: AN EVALUATION OF TECHNIQUES,
Australian Water Resources Council, Camberra. Dept. of National Development.
C. S. Christian, R. O. Slatyer, C. E. Hounam, K. C. Leverington, and W. C. Swinbank.
Australian Water Resources Council Hydrological Series 5, 1970. 23 p, 49 ref.

Descriptors: *Evapotranspiration, *Energy budget, *Water balance, *Transpiration, *Hydrologic cycle, Water conservation, Saturated soils, Lysimeters, Irrigation effects, Microenvironment, Soil water movement, Evaporation, Moisture content, Water loss, Percolation, Underseepage, Infiltration, Wilting point, Forests, Soil properties.
Identifiers: Soil water storage.

This report reviews some of the experimental and theoretical procedures used in the evaluation and study of soil and plant evapotranspiration. It discusses the use of lysimeters of the soil-weighing type used in measuring evaporation rates. In this connection it is quite possible that weighing lysimeters can provide a more accurate measurement than the energy balance approach. However, their constant use under all conditions is somewhat restricted as the plant and soil community reproduced within the lysimeter pot must match very closely the plant and soil community being studies so as to obtain an accurate evaporation reading. This report further states that it is believed at present that the only suitable method for the measurement of evaporation from most land surfaces is that based on the evaluation of surface energy balance. Also included are specific mathematical formulas relating to catchment studies, energy balance approach, instrumentation, and estimation procedures. (Glasby-USGS)

I. V. Ryabkov.
Akademiya nauk SSSR Izvestiya, Seriya Geograficheskaya, no 1, p 100-108, Jan-Feb, 1971. 9 p, 4 fig, 4 ref.

Descriptors: *Geologic investigations, *History, Interfluves, *Rivers, Hydrography, Stratigraphy, Quaternary period, Canyons, Valleys, Pleistocene epoch, Geomorphology, Palynology, Terraces (Geological), Cross-sections.
Identifiers: *USSR, *Caspian Sea, Kama River, Pechora River, Vychegda River, Paleogeography, Quaternary deposits.

Drilling operations along the tributaries of the Kama and Vychegda Rivers show a deep valley referred to in literature as the 'Kel'tminskiy canyon.' A similar deepening was discovered in 1967 north of the canyon along the Vychegda and Pechora tributaries. Subsequent investigations to the east have uncovered ancient valleys along the Kama and Pechora tributaries. Subsequent investigations to the east have uncovered ancient valleys along the Kama and Pechora tributaries. The Kama, Pechora and Vychegda basin may be used to compare and correlate the stratigraphy of Quaternary deposits in the Caspian and Severnyy (boreal) basins. Reconstruction of the historical development of the basin's stream network is valuable for correlating the Pleistocene deposits filling the valleys for drafting local measures to divert runoff of northern rivers into the Caspian Sea. (Josefson-USGS)
W71-09102

HYDROLOGIC AND QUALITY CHARACTERISTICS OF THE LOWER MISSISSIPPI RIVER,
Geological Survey, Baton Rouge, La.
Jane E. Everett.
Louisiana Department of Public Works Technical Report No 5, 1971. 48 p, 34 fig, 3 plate, 4 tab, 8 ref.

Descriptors: *Mississippi River, *Louisiana, *Water quality, *Industrial wastes, *Water pollution, Water utilization, Sewage, Sediment load, Suspension, Colloids, Sediment transport, Industrial water, Chemical wastes, Pollutants, Waste disposal, Waste water disposal, Municipal wastes, Sewage treatment, Sewage effluents, Public health, River flow, Open channel flow, Flow rates.
Identifiers: New Orleans (La), Baton Rouge (La).

Maintaining the suitability of its water for municipal and industrial uses must be included in the proper utilization of the lower Mississippi River. The average daily flow of the Mississippi River at Vicksburg is 551,100 cfs, ranging from a high of 780,000 cfs on May 4, 1927, to a low of 100,000 cfs on October 17, 1939. Sediment concentrations at Red River Landing range from about 10 to 2,500 mg/l. The average annual suspended-sediment load is 450,000 tons per day, ranging from 288,000 tons per day in 1963 to 1,580,000 tons per day in 1951. Industrial demands for water from the Mississippi River have increased from 2.0 bgd in 1960 to 5.0 bgd in 1969; 95% of this water is returned to the river. Domestic sewage discharged into the Mississippi River causes high bacterial concentrations. In 1962 the coliform content exceeded 5,000 colonies per 100 milliliters about 13% of the time at the New Orleans Carrollton Street intake (mile 104) and about 35% of the time at the Algiers intake (mile 95). When the river is flowing at a rate of 600,000 cfs an accidental spill of 1,000 pounds of contaminant at Baton Rouge would have a peak concentration in New Orleans of 0.83 micrograms per liter 60 hours later. Under average flow conditions the rate of lateral dispersion of bank-injected contaminants would be about 250 feet per mile in straight reaches of the river. (Glasby-USGS)

REFINING THE CALCULATION AND FORECAST OF RAINFALL RUNOFF OF LARGE AND MEDIUM-SIZE RIVERS BY RUNOFF FROM SMALL BASINS, (RUSSIAN: UTOCHNENIYE METODA VYCHISLENIYA I PROGNOZA DOZHDEVOGO STOKA BOL'SHIKH I SREDNIKH REK PO STOKU S MALYKH BASSEYNOV),
N. N. Osadchaya.
In: Problems in Hydrological Forecasting (Voprosy gidrologicheskikh prognozov, Gosudarstvennyy Ordena Trudovogo Znameni Gidrologicheskiy Institut Trudy, No 179; Gidrometeoizdat, Leningrad, p 136-163, 1970. 28 p, 5 fig, 5 tab, 3 ref, 3 append.

Descriptors: *Runoff forecasting, *Runoff, *Rivers, *Watersheds (Basins), Inflow, Low flow, Precipitation (Atmospheric), Reservoirs.
Identifiers: *USSR, Ukraine, Dnieper River, Runoff plots.

The possibility of applying a method of forecasting runoff by dividing a basin into uniform plots and of using the method for making advance estimates of runoff for various-size rivers is examined. An average plot size of 2,500 sq km, previously used for a basin between the Dnieper River and the Kiev hydroelectric power plant, may be increased to 6,000 and even to as much as 8,000 sq km. A prediction of ten-day low flow 30 days in advance yields positive results only for large basins exceeding 100,000 sq km. Satisfactory predictions of low flow can be made 20 days in advance for basin areas 50,000-100,000 sq km and 10 days in advance for basins between 20,000 and 50,000 sq km. Generally it is possible to make a reliable prediction of minimum daily runoff 10 days in advance and in the case of large basins (100,000 sq km) 20 days in advance. A refining of the method of forecasting water flow to the reservoir of the Kiev power plant by increasing size of runoff plots and by reducing the number of plots used simplifies the work of preparing forecasts for reservoir operation. CALCULATING RAINFALL RUNOFF LOSSES BY PRECIPITATION AND RUNOFF OF SMALL RIVERS USING THE DNIEPER RIVER-RECHITSA BASIN AS AN EXAMPLE (RUSSIAN: VYCHISLENIYE POTER' DOZHDEVOGO STOKA PO OSADKAM I STOKU MALYKH REK NA PRIMERE BASSEYNA R. DNEPRA DO G. RECHITSY),
T. I. Meyerson.
In: Problems in Hydrological Forecasting (Voprosy gidrologicheskikh prognozov), Gosudarstvennyy Ordena Trudovogo Znameni Gidrologicheskiy Institut Trudy, No 179; Gidrometeoizdat, Leningrad, p 117-135, 1970. 19 p, 3 fig, 4 tab, 10 ref, append.

Descriptors: *Rainfall-runoff relationships, *Precipitation (Atmospheric), *Runoff, *Rivers, *Inflow, Meteorological data, Time lag, Water loss, Streamflow forecasting.
Identifiers: *USSR, Dnieper River, Travel time.

A possibility of calculating rainfall losses of large rivers by the relationship of total runoff of small rivers to precipitation, termed the coefficient of inflow, is examined. In contrast to the runoff coefficient, defined as the ratio of runoff at a basin outlet to precipitation, the inflow coefficient is a more accurate description of losses, since it excludes the effect of transformations of inflow by large rivers. Runoff of the Dnieper River-Rechitsa basin is calculated from actual precipitation and from the inflow and runoff coefficients, which are determined from the relationships of each of the coefficients to antecedent basin conditions. Flow at the outlet of a large basin, computed by summarizing runoff derived from precipitation data of sub basins, yields better results than computing flow at the outlet of a large basin by application of precipitation data over the large basin. DEPLETION OF STREAMFLOW BY INFILTRATION IN THE MAIN CHANNELS OF THE TUCSON BASIN, SOUTHEASTERN ARIZONA,
Geological Survey, Washington, D.C.
D. E. Burkham.
For sale by Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. Price $0.65. Geological Survey Water-Supply Paper 1939-B, 1970. 36 p, 11 fig, 1 plate, 7 tab, 1 ref.

Descriptors: *Ephemeral streams, *Streambeds, *Infiltration, *Streamflow, *Arizona, Channel morphology, Surface-groundwater relationships, Water yield, Rainfall-runoff relationships, Stream gages, Hydrologic data, Data collections, Mathematical studies, Hydrogeology, Aquifer characteristics, Groundwater recharge, Inflow, Duration curves.
Identifiers: *Tucson Basin (Ariz), Streamflow depletion, Infiltration rate.

Estimates were made of the average annual volume of infiltration for the period 1936-63 along seven normally dry alluvial channels in the Tucson basin of southeastern Arizona. The essential parts of the method used to estimate infiltration were (1) average relation between rates of inflow and infiltration and (2) flow-duration curves of streamflow. The main channels of the Tucson basin are efficient natural infiltration galleries. The average annual streamflow depletion ranged from about 30 to 90 percent of the average annual inflow to the seven reaches for the period 1936-63. The average an-

nual inflow to all the reaches was about 66,000 acre-feet; of this about 47,000 acre-feet, or 70 percent, was depleted by infiltration, and about 19,000 acre-feet flowed out of the basin. The annual variation in infiltration volumes along the main channels is large and is mainly the result of variation in streamflow. (Woodard-USGS)

GRAPHICAL CONVERSION OF A STAGE HYDROGRAPH TO A DISCHARGE HYDROGRAPH,
Pennsylvania State Univ., University Park. Dept. of Geology and Geophysics.
Leonard F. Konikow.
Journal of Soil and Water Conservation, Vol 26, No 3, p 116-117, May-June 1971. 2 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Stage-discharge relations, *Data processing, Data collections, Water levels, Discharge (Water), Streamflow, Gaging stations, Stream gages.
Identifiers: *Rating curves.

A rating curve is used to determine the discharge or extrapolate it for all recorded stream gages. The time spent converting stage to discharge may be shortened considerably by using a transparent overlay with a vertical scale of discharge values calculated from the rating curve. When the transparency is placed properly over a completed water-level recorder chart, the stage hydrograph becomes a discharge hydrograph. While this technique is particularly applicable to gaging stations with a stable stage-discharge relationship, a new overlay can easily be prepared if the rating curve shifts. The time and cost to do so is small. (Knapp-USGS)

RIVER RUNOFF - THEORY AND ANALYSIS,
D. L. Sokolovskii.
Available from the National Technical Information Service as TT70-50058, $3.00 in paper copy, $0.95 in microfiche. Jerusalem, Israel Program for Scientific Translations, 1971. 3d ed. 489 p.

Descriptors: *Stage-discharge relations, *Rainfall-runoff relationships, *Runoff forecasting, *Streamflow forecasting, *Water balance, Mathematical models, Hydrogeology, Water management (Applied), Systems analysis, Runoff, Streamflow, Lakes, Hydrology, Evapotranspiration, Statistical methods, Peak discharge, Low flow, Flood forecasting, Sediment discharge, Sediment transport, Silting, Computer programs.
Identifiers: *River runoff analysis.

This book, which deals with fundamentals of river runoff theory and with practical methods for computing characteristics of average annual runoff and its long-term distribution, seasonal distribution of runoff, maximum runoff of spring and rainfall floods, sediment discharge, and other characteristics of river hydrology, is intended for students studying hydrometeorology and geography. It may also serve as a theoretical and practical handbook for hydrological engineers, hydraulic engineers and other specialists dealing with the design and operation of water management structures. This edition differs from the first two editions (published in 1952 and 1959) by the inclusion of numerous changes and additions reflecting modern achievements in hydrology and requirements for hydrology and for runoff computations. Sections are included on the basic concepts of probability theory, determination of the long-term average groundwater flow of USSR rivers, methods for investigating patterns of annual runoff fluctuations, use of electronic analog computers in flood computations, the unit hydrograph method, hydrological and hydrometeorological computations in the design of irrigation systems, and methods for calculating maximum stages. GEOLOGY AND GROUNDWATER RESOURCES OF TRAILL COUNTY: PART 3 GROUNDWATER RESOURCES,
Geological Survey, Bismark, N. Dak.
H. M. Jensen, and R. L. Klausing.
North Dakota Geological Survey Bulletin 49 and North Dakota Water Commission County Groundwater Studies 10, 1971. 40 p, 13 fig, 1 plate, 2 tab, 28 ref, append.

Descriptors: *Groundwater, *Water resources development, *Hydrologic data, *Aquifer characteristics, *North Dakota, Water wells, Hydrogeology, Water sources, Aquifers, Geology, Water table, Water levels, Water yield, Water level fluctuations, Water utilization, Water quality, Chemical analysis, Precipitation (Atmospheric), Data collections.
Identifiers: *Groundwater resources, *Traill County (N Dak).

Groundwater in Traill County is obtainable from sand and gravel deposits associated with the glacial drift of Pleistocene age and from sand and (or) sandstone beds in the Dakota Group of Late Cretaceous age. The principal aquifers are the Dakota, Hillsboro, Galesburg, Elk Valley, and Belmont aquifers. The Dakota aquifer, which is the largest and most productive aquifer in the county, yields more than a million gallons of highly mineralized water per day. The water may be either a sodium sulfate or sodium chloride type; however, sodium sulfate is the predominant water type. The dissolved-solids content of 29 samples of water ranged from 1,990 to 5,710 ppm and averaged 3,790 ppm. Sulfate content ranged from 355 to 3,220 ppm and averaged 1,320 ppm. The Hillsboro and Galesburg aquifers offer the most potential for future development. Individual well yields from the Hillsboro and Galesburg aquifers may be as much as 500 and 250 gallons per minute, respectively. Aquifers of less importance are present in the glacial drift, but they are relatively thin and of small areal extent. These aquifers yield adequate supplies of water for average domestic and livestock uses. (Woodard-USGS)

RECORDS OF PRECIPITATION, WATER LEVELS AND GROUNDWATER RECHARGE TO THE EDWARDS AND ASSOCIATED LIMESTONES, SAN ANTONIO AREA, TEXAS, 1970,
Geological Survey, San Antonio, Tex.
Celso Puente.
Edwards Underground Water District Bulletin 27 (Texas), Apr 1971. 11 p, 4 tab, 12 ref.

Descriptors: *Groundwater, *Hydrogeology, *Aquifer characteristics, *Water levels, *Texas, Precipitation (Atmospheric), Groundwater recharge, Groundwater movement, Aquifers, Storage, Streamflow, Flow rates, Rainfall-runoff relationships, Surface-groundwater relationships, Water level fluctuations, Hydrologic data.
Identifiers: *Groundwater resources.

Records of precipitation, water levels, and estimates of recharge to the Edwards and associated limestones in the San Antonio, Texas area during 1970 are summarized. Rainfall for 1970 was below average throughout most of the recharge area. The water levels fluctuated just below the record high, owing to recharge from high flood runoff during intense storms. Groundwater storage in the Edwards Limestone remained above average during 1970. The estimated recharge was 661,600 acre-feet, which is about 30 percent above the average recharge for the period 1934-69. (Woodard-USGS)

HEAT TRANSFER MEASUREMENT IN A GEOTHERMAL AREA,
National Research Center for Disaster Prevention, Tokyo (Japan).
Kozo Yuhara.
Tectonophysics, Vol 10, No 1-3, p 19-30, 1970. 12 p, 7 fig, 4 tab, 8 ref.

Descriptors: *Geysers, *Heat flow, *Heat transfer, Mass transfer, Hot springs, Geothermal studies, Boiling, Convection, Cooling, Heat balance, Heat budget, Steam.
Identifiers: *Geothermal areas, *Japan.

In Japan, there are about twenty geothermal areas, where heat is transferred by fumaroles, steam wells, hot springs, steaming grounds, evaporation from hot pools and thermal conduction through the earth. Methods of heat transfer measurement used at Owakudani and Sounzan geothermal areas of Hakone Volcano are outlined. Total mass discharge from these areas amounts to 129 kg/sec and total heat transfer amounts to 10.64 million cal./sec. Heat transferred from all geothermal areas of Japan may be estimated roughly to be 2 times 10 to the 23rd power erg/year. Adding to this the energy released by volcanic activity, hot springs, and the normal heat flow of non-volcanic regions, the total energy released from the whole of Japan, exclusive of that by earthquakes is about 9 times 10 to the 24th power erg/year. (Knapp-USGS)

HEAT FLOW FROM NATURAL GEYSERS,
ESSA Research Labs., Boulder, Colo.; and Colorado Univ., Boulder. Dept. of Mechanical Engineering.
John Rinehart.
Tectonophysics, Vol 10, no 1-3, p 11-17, Sept 1970. 7 p, 5 fig, 7 ref.

Descriptors: *Geysers, *Heat flow, *Heat transfer, Mass transfer, Hot springs, Geothermal studies, Boiling, Convection, Cooling, Heat balance, Heat budget, Steam.
Identifiers: *Geothermal areas.

A natural geyser is a mechanism that extracts heat from the earth. Trapped meteoric water is heated and then thrown clear of its reservoir as hot water or steam, carrying heat with it. There are two basic types of geysers: Columnar, discharging quantities of hot water; and pool, in which the eruption consists of a series of detonating steam explosions. Results of temperature measurements made deep within several geysers permit calculation of their respective approximate rates of heat extraction. Old Faithful, which discharges large quantities of water, extracts heat at the approximate rate of 1.34 million cal./sec. Narcissus, an explosive type geyser, develops power at the approximate rate of 3 thousand cal./sec, and Solitary, another explosive geyser, at the rate of 6.4 thousand cal./sec. (Knapp-USGS)

Geological Survey Open-file Report, July 24, 1969. p, 10 fig, 11 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Aquifer characteristics, *California, Water table, Water levels, Reviews, Observation wells, Specific capacity, Withdrawal, Groundwater recharge, Water temperature, Water yield, Water quality, Chemical analysis, Dissolved solids, Aquifers.
Identifiers: *Groundwater data (Calif).

The groundwater data for the 11 hydrologic subregions of the California Region are summarized. Data for the observation wells include basin name, area of basin, depth to water in feet below land-surface datum, storage capacity, range of temperature, range of dissolved solids, and withdrawal capacity. Summaries for the Delta-Central Sierra Subregion, the Tulare Basin Subregion, and the San Joaquin Basin Subregion are combined. In addition to this report, the Geological Survey has prepared a series of nine reports for the 11 subregions. Each report contains data in a more complete form and an extensive list of publications by the U.S. Geological Survey and the California Department of Water Resources. (Woodard-USGS)

WATER LEVELS IN CARBONATE ROCK TERRANES,
Geological Survey, Raleigh, N.C.; and Geological Survey, Washington, D.C. Water Resources Div.
Harry E. Le Grand, and V. T. Stringfield.
Ground Water, Vol 9, No 3, p 4-10, May-June 1971. 7 p, 3 fig, 16 ref.

Descriptors: *Water levels, *Hydrogeology, *Groundwater movement, *Water level fluctuations, *Karst, Limestones, Fissures (Geology), Permeability, Infiltration, Percolation, Water table, Topography, Climates, Springs, Water wells, Water yield, Water circulation, Carbonate rocks.
Identifiers: *Solution channels (Karst).

The depth to the water table in carbonate rocks is controlled by local factors such as permeability and topography and by the regional factor of climate; both permeability and topography are dynamically developed according to the degree of preferential circulation of subsurface water and of solution of the rock. The water table responds by lying deep beneath hilly permeable karstlands and shallow beneath flat and poorly permeable carbonate rocks. The uneven distribution of permeability and of topographic conditions is responsible for the karst phenomena of disappearing and reappearing surface streams. Great infiltration capacities of some karst regions result in large local fluctuations of the water table and in some cases in local reversals in direction of groundwater flow between wet and dry seasons. Water-level behavior in space and time is a primary consideration for interpreting the hydrology of carbonate terranes. (Knapp-USGS)

HYDRAULIC TESTING OF WELL HTH-23 IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-23 (AEC), (Central Nevada-32), June 1970. 34 p, 22 fig, 1 tab, 1 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

An analysis is presented of data obtained during hydraulic tests in hydrologic test hole HTH-23, Little Smoky Valley, Nevada. The analysis focused primarily on determining transmissivity of selected intervals within the zone of interest. Further analysis is concerned with determining variations in hydraulic potential in the vertical section and transmissivity, hydraulic conductivity, storage coefficient, and velocity of groundwater movement. Hole HTH-23 penetrated alluvium, welded tuff, and tuffaceous sediments. The composite water level for the interval from 1,337.6 to 2,285.9 m was 138.8 m below land-surface datum. Transmissivity ranged from an estimated 0.00062 to 5.8 cubic meters per day per meter; hydraulic conductivity ranged from an estimated 0.0000084 to 0.15 cubic meters per day per square meter; and velocity was as high as 0.0045 meters per day. Velocities of groundwater movement through some intervals might be significantly greater. (See also W71-09325 thru W71-09331) (Knapp-USGS)
W71-09324

HYDRAULIC TESTING OF WELL HTH-4 IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-31 (AEC), (Central Nevada-34), June 1970. 21 p, 10 fig, 1 tab, 2 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

An analysis is presented of data obtained during hydraulic tests in hydrologic test in hydrologic test hole NTH-4, Little Smoky Valley, Nevada. The

analysis is focused primarily on determining variations in hydraulic potential in the vertical section and transmissivity, hydraulic conductivity, storage coefficient, and velocity of groundwater movement. Hole HTH-4 penetrated alluvium, rhyolite, and welded tuff. The composite water level was 157.5 m below land-surface datum. Transmissivity ranged from an estimated 0.0073 to 7.3 cubic meters per day per meter; hydraulic conductivity ranged from an estimated 0.0008 to 0.8 cubic meters per day per square meter; and velocity ranged from an estimated 0.00032 to 0.019 meters per day. However, all of these values probably are low. During the cementing process, drilling mud and cement were forced into the water-bearing fractures and effectively sealed them from the borehole. (See also W71-09324) (Knapp-USGS)
W71-09325

HYDRAULIC TESTING OF WELL HTH-3 IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-34 (AEC), (Central Nevada-35), June 1970. 24 p, 12 fig, 1 tab, 2 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

An analysis is presented of data obtained during hydraulic tests in hydrologic test hole NTH-3, Little Smoky Valley, Nevada. The analysis is focused primarily on determining variations in hydraulic potential in the vertical section and transmissivity, hydraulic conductivity, storage coefficient, and velocity of groundwater movement in selected intervals of anticipated high permeability. Hole HTH-3 penetrated alluvium, tuff, and tuffaceous sandstone and claystone. The composite water level for the interval from 1,431.6 to 1,831.5 m was 172.67 m below land-surface datum. In the tested intervals from which the data were adequate for analysis, transmissivity ranged from 0.97 to 2.9 cubic meters per day per meter; hydraulic conductivity ranged from 0.01 to 0.23 cubic meters per day per square meter; and velocity ranged from 0.002 to 0.046 meters per day. (See also W71-09324) (Knapp-USGS)
W71-09326

HYDRAULIC TESTING OF WELL HTH-5 IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-39 (AEC), (Central Nevada-37), June 1970. 15 p, 5 fig, 1 tab, 1 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

An analysis is presented of data obtained during hydraulic tests in hydrologic test hole HTH-5, Hot Creek Valley, Nevada. Data collection was focused primarily on determining variations in hydraulic potential in the vertical section and permeability of the most transmissive intervals. Hole HTH-5 penetrated alluvium, tuffaceous sandstone and siltstone, and welded tuff with thin intervals of bedded tuff. The composite water level with the hole open from 635.2 to 1,830.8 m and with the casing perforated in two intervals from 173.7 to 179.8 m and from 536.4 to 551.7 m was 35.1 m below land-surface datum. In the tested intervals from which the data were adequate for analysis, static water levels ranged from 38.42 m below land-surface datum to 136.5 m above land-surface datum and relative specific capacities ranged from an estimated 0.00006 to 0.18 cubic meters per day per meter of drawdown. (See also W71-09324) (Knapp-USGS)
W71-09327

HYDRAULIC TESTING AND SAMPLING OF HOLE Ue-1, IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS 474-77 (AEC), (Central Nevada-7), June 1970. 25 p, 12 fig, 1 tab. USAEC Contract No AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

Hydraulic testing and sampling of hole Ue-1 for the U.S. Atomic Energy Commission's underground nuclear testing program in central Nevada began on January 31, 1967, and ended on February 13, 1967. Depth intervals tested and sampled were: zone 1, 1,710 feet to total depth; zone 2, 1,508 to 1,706 feet; zone 3, 1,266 to 1,464 feet; zone 4, 788 to 986 feet; and zone 5, 400 to 598 feet. Injection and recovery tests were run on each depth interval. Relative specific capacities calculated from injection data were much smaller than those calculated from recovery data. Mud and lost circulation material in the hole and in the formation during the injection test account for the different relative specific capacities. Comparative composite hydrostatic heads before and after the injection and recovery tests were 211.5 feet below land-surface datum and 218.0 feet below lsd. The difference may be due to differences in the conditions of the measurements. (See also W71-09324) (Knapp-USGS)
W71-09328

HYDRAULIC TESTING AND SAMPLING OF HOLE Ue-2, IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-78 (AEC), (Central Nevada-8), June 1970. 23 p, 11 fig, 1 tab. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

Hydraulic testing and sampling of hole Ue-2 for the U.S. Atomic Energy Commission's underground nuclear testing program in central Nevada began on January 16, 1967, and ended on January 22, 1967. Seven depth intervals, beginning at 434 feet and extending to total depth, were tested and sampled. Injection tests were run on all depth intervals; recovery tests were run on intervals 2 through 7. In only one interval (zone 4) was the recovery-test curve suitable for determining relative specific capacity. In the zone, relative specific capacity calculated from recovery data was much less than that calculated from injection data. The composite hydrostatic head before and after injection and recovery tests was 579.6 feet below land-surface datum. In all zones where the static water level was measured after injection and then after swabbing (zones 3, 5, 6, and 7) the static water level changed after swabbing. (See also W71-09324) (Knapp-USGS)
W71-09329

HYDRAULIC TESTING AND SAMPLING OF HOLE Ue-3, IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-79 (AEC), (Central Nevada-9), June 1970. 21 p, 11 fig. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igeneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

Hydraulic testing and sampling of hole Ue-3 for the U.S. Atomic Energy Commission's underground nuclear testing program in Central Nevada began on February 11, 1967, and ended on February 19, 1967. Depth intervals tested were: zone 1, 1,492 feet to total depth; zone 2, 1,310 to 1,488 feet; zone 3, 1,004 to 1,182 feet; zone 4, 865 to 1,043 feet; zone 5, 610 to 788 feet; and zone 6, surface to 400 feet. Permeability of zones 3, 4 and 5 is high whereas permeability of zone 1 is low. Mud in the borehole made a pretest determination of the composite hydrostatic head impossible. After testing, the static water level was 238.13 feet below land-surface datum. (See also W71-09324) (Knapp-USGS)

HYDRAULIC TESTING OF WELL HTH-21-1 IN CENTRAL NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-81 (AEC), (Central Nevada-22), June 1970. 34 p, 23 fig, 1 tab, 1 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

An analysis is presented of data obtained during hydraulic tests in hydrologic test hole HTH-21-1, Little Smoky Valley, Nevada. The analysis is focused primarily on determining transmissivity of selected intervals within the zone of interest. Further analysis is concerned with determining variations in hydraulic conductivity, storage coefficient, and velocity of groundwater movement in selected intervals of the entire hole. Hole HTH-21-1 penetrated alluvium, tuff, and tuffaceous sediments. The composite water level was 151.56 m below land-surface datum. In the tested intervals from which the data were adequate for analysis, transmissivity ranged from an estimated .000014 to 23.1 cubic meters per day per meter. (See also W71-09324) (Knapp-USGS)

ne behavior of a porous bed in the vicinity of a w singularity that was imposed by the nonorthogonality of a potential line and a stream- e was studied theoretically and experimentally. ow of water under a circular cylinder that is par- lly imbedded in sand results in nonorthogonality the intersection of sand and cylinder unless the linder is half imbedded. The seepage force can theoretically infinite at the singular point. Ex- riments were conducted that led to boiling, heav- g, and piping for the partially-imbedded cylinder. sults of the experiment indicate that the flow sin- larity of nonorthogonality is not very serious cause nature apparently corrects for this anoma- by a readjustment of flow in the vicinity of the gularity. Furthmore, a more detailed investiga- n of the analytical solution in the vicinity of the gularity shows that, if the hydraulic gradient is aluated in terms of the sand diameter in the inity of singularity point, the seepage force may t actually be very large. OLUTES IN PRESSURE MEMBRANE FIL- ATES OF SEVERAL CLAY-WATER-ELEC- OLYTE SYSTEMS,
rth Carolina State Univ., Raleigh. Dept. of Soil ence.
nes Burton Hart Jr.
D Thesis, North Carolina State University, 70. 109 p, 13 fig, 24 tab, 106 ref. OWRR Project 008-NC (4).

scriptors: *Soil water movement, *Clays, *Soil ssure, *Water chemistry, *Diffusion, Ion change, Filtration, Model studies, Hydrogeology, alytical techniques, X-ray diffraction, Clay nerals, Chemical analysis, Soil water.
ntifiers: *Soils (Pressure filtration).

aluation is made of the composition of solutions ced out of clay suspensions by pressure dif- entials applied in a conventional pressure mem- ne apparatus and a standardized filtration hnique. Suspensions studied include Ca-satu- ed kaolinite and Na- and Ca-saturated mont- rillonite suspended in water or 0.1 N chloride s of the respective saturating cations. Specifi- y, the purpose was to determine the concentra- n of cations (Na or Ca) and anions (Cl) in fil- es extracted at various pressures, and the extent which the clay suspensions released other com- ents (including H, OH, Si, and Al species) dur- extraction. A series of clay-water-electrolyte pensions were prepared, characterized, and sub- ed to successive pressure increments. The fil- es were collected, analyzed, and evaluated with pect to solute composition and the chemical sta- y of the clays in the suspensions. The water ined by the clays decreased in the order Na- ntmorillonite, Ca-montmorillonite, and Ca- linite for the initial pressures and tended to rease to a common level at the final pressure. oodard-USGS)

CONSOLIDATION CHARACTERISTICS OF SOME PLEISTOCENE PERIGLACIAL METASTABLE SOILS OF EAST KENT,
Imperial Coll. of Science and Techology, London (England). Dept. of Geology.
Peter George Fookes, and Robert Best.
Quarterly Journal of Engineering Geology, Vol 2, No 2, p 103-127, Dec 15, 1969. 25 p, 12 fig, 2 tab, 30 ref.

Descriptors: *Loess, *Aeolian soils, *Soil stability, *Consolidation, Soil physical properties, Slope stability, Soil strength, Soil mechanics.
Identifiers: Kent (U.K.).

Metastable partially saturated soils are those which on wetting under load undergo a sudden decrease of void ratio and structural collapse. One of the most important soils of this group is loess, a silty quartzose sediment of uniform grading. This paper deals principally with the geotechnical and mineralogical characteristics of east Kent (U.K.) loess. A coarser grained poorly sorted glacial solifluxion soil from Kent was also examined and found to be metastable. Because material of this type is fairly common this observation could have significant engineering implications. (Knapp-USGS)

A MODEL STUDY OF THE SQUEEZING OUT OF INTERSTITIAL WATERS, (Russian: K voprosu ob izuchenii na modelyakh protsessa otzhatiya sedimentatsionnykh vod),
Institut Prirodnogo Gaza, Moscow (USSR).
V. L. Sokolov, and V. F. Simonenko.
Akademiya Nauk SSSR Izvestiya, Seriya Geologicheskaya, No 3, p 117-121, Mar 1971. 5 p, 1 fig, 19 ref.

Descriptors: *Model studies, *Connate water, *Geochemistry, *Hydrodynamics, Loads (Forces), Pressure, Compaction, Water properties, Clays, Diagenesis, Sediments, Lithification, Organic matter, Electrolytes.
Identifiers: *USSR, *Black Sea, Mineralization, Hydrocarbons, Geostatic pressure, Plastic flow.

The squeezing out of interstitial waters from sinking clay strata is a continuous process within a very wide range of depths, including the catagenetic zone. The process, which begins at the first stages of compaction and mineralization, parallels thermocatalytic transformation of organic matter by stimulating the initial migration of hydrocarbons. Black Sea muds were squeezed from 25 to 8,000 kg/sq cm, with a smoothly increasing load, for 38 days. The amount of squeezed-out interstitial water varies with compression rate at constant temperature and pressure. The remaining moisture after rapid compression is 9% and after slow compression, 2.8%. With rapid increases in load, some of the water cannot be squeezed out completely; the boundary of complete squeezing out of interstitial water from a sinking sediment may be quite deep. Assuming that the end of the squeezing out of interstitial waters takes place with a differential pressure of the order of 200 atm, the boundary of complete squeezing out of interstitial waters should be at a depth of about 4,000 m. SOIL: A NATURAL SINK FOR CARBON MONOXIDE,
Stanford Research Inst., Irvine, Calif.
Robert E. Inman, Royal B. Ingersoll, and Elaine A. Levy.
Supported by Environmental Protection Agency and the Coordinating Research Council. Science, Vol 172, No 3989, p 1229-1231, June 18, 1971. 3 p, 2 fig, 11 ref.

Descriptors: *Soil physics, *Gases, *Air environment, *Soil microogranisms, *Air pollution, Fallout, Soil chemistry, Application method.
Identifiers: *Carbon monoxide, *Natural sinks (Gases).

The role of the soil as a natural sink into which carbon monoxide can readily disappear from the earth's atmosphere is described on the basis of measurements made on soil samples from California, Florida, and Hawaii. Most of the soils showed a surprising capability to remove CO from the test atmospheres. A plotting soil mixture depleted CO in a test atmosphere from a concentration of 120 ppm to near zero within 3 hours. Maximum activity occurred at 30 deg C. Steam sterilization of the soil, the addition or antibiotics or 10% (by weight) saline solution, and anaerobic conditions all prevented carbon monoxide intake. Sterilized soil inoculated with nonsterile soil acquired activity with time. Samples of various natural soils differed in their ability to remove CO from the air. Acidic soils with a high content of organic matter were the most active. Soil ability to remove CO from the atmosphere is ascribed to the activity of soil microorganisms. Average soil activity tested (8.44 mg of CO per hr per sq meter of soil) is equivalent to 191 metric tons per year sq mi, which is 6.5 times the annual estimated production of CO in the United States. The soil is thus a major natural sink for CO that is released into the air by nature or by the burning of fossil fuels. (Lang-USGS)

ISOLATION AND IDENTIFICATION OF STEROLS FROM A PLEISTOCENE SEDIMENT,
California Univ., Berkeley. Dept. of Chemistry.
William Henderson, Walter E. Reed, Gordon Steel, and Melvin Calvin.
Nature, Vol 231, No 5301, p 308-309, June 4, 1971. 2 p, 1 fig, 1 tab, 11 ref. Supported by NASA.

Descriptors: *Sedimentology, *Surface waters, *Sediments, *Dating, *Geologic time, Analytical techniques, Instrumentation, Gas chromatography, Spectrometers, Biological properties, California.
Identifiers: *Sterols, *Pleistocene sediment, Mono Lake.

Analysis of sediments for relatively unaltered molecules such as sterols which are present in sea water, bottom muds (both marine and non-marine), surface soils, and an Eocene shale is discussed. Sediments deposited in Mono Lake, California show no clearly freshwater fauna but contain an abundance of algal debris, diatoms, ostracods, and, locally, gastropods. The sediment analyzed contained alternate bands of algal silt and diatomite. It resides within a complete Pleistocene lacustrine sequence and its position within that sequence (that is, 80 m below the top of the Wilson Creek Formation, which is the latest Pleistocene sediment exposed in the Mono Basin) suggests an age about 130,000 yr. Identifiers: Tenth Microbiological Congress.

The 10th International Microbiological Congress held in Mexico City during August 9-15, 1970, was attended by more than 1,000 scientists from different parts of the world. The program embraced the general microbiology, taxonomy, genetics, agricultural microbiology, and technical microbiology. Special session was dedicated to microorganisms of seas and freshwater basins. In discussion of water-inhabiting saprophytic and autotrophic microorganisms attention was given to processes taking place in purification of water reservoirs. The participants decided to replace in the future the general congresses by meetings of narrower divisions, such as bacteriology, mycology, and virology. (Wilde-Wisconsin)

ASYMMETRY OF THE INTERNAL SEICHE IN LOCH NESS,
National Inst. of Oceanography, Wormley (England).
S. A. Thorpe.
Nature, Vol 231, No 5301, p 306-308, June 4, 1971. 3 p, 3 fig, 13 ref.

Descriptors: *Seiches, *Water circulation, *Surface waters, *Investigations, *Data collections, Analytical techniques, Water temperature, Winds, Water levels, Lakes, On-site investigations, Model studies.
Identifiers: *Loch Ness (Scotland), Asymmetry.

Loch Ness, Scotland seems to be particularly suitable for internal wave research. Because it is freshwater the effects of salinity, which are so difficult to monitor in the ocean, are absent. The dominant internal seiche has a wave-length twice the length of the Loch, and a marked asymmetry. Observations of the temperature structure of the Loch, using thermistors at ten levels at a station in Urquhart Bay were made from September 7 to October 12, 1970, and these confirm the asymmetrical shape of the seiche determined earlier. The asymmetry of the internal seiche of Loch Ness seems to be the result of a tendency for internal surges as a result of non-linear long wave effects. It is likely that the effect of the Earth's rotation is principally to cause a small alternating transverse tilt of the isotherms across the Loch during the seiching motion. (Woodard-USGS)

PREDICTION OF IN-SITU ACOUSTIC AND ELASTIC PROPERTIES OF MARINE SEDIMENTS,
Naval Undersea Research and Development Center, San Diego, Calif.
Edwin L. Hamilton.
Geophysics, Vol 36, No 2, p 266-284, Apr 1971. 19 p, 3 fig, 7 tab, 69 ref, append.

Descriptors: *Bottom sediments, *Accoustics, *Mechanical properties, *Elasticity (Mechanical), Porosity, Shear strength, Velocity, Seismic studies, Sampling, Surveys, Geophysics, Density.
Identifiers: Acoustic properties (Sediments), Elastic properties (Sediments).

This is one of several interrelated reports concerning sound velocity, elasticity, and related properties of marine sediments from several major environments in the North Pacific and adjacent areas. This report is concerned with the correction of laboratory values to in-situ values, and the prediction of in-situ values in the absence of any sediment data. Although the samples and values are related to the North Pacific and adjacent areas, the methods and techniques of prediction are applicable to other areas and sediments. The keys to prediction of in-situ properties of marine sediments are knowledge of (1) general physiographic provinces and their associated sediments, (2) sedimentary processes within these environments, (3) laboratory or in-situ values of properties of the principal sediment types within the environments, and (4) methods of correcting laboratory values to in-situ values. Using measured values of density and compressional-wave velocity (corrected to in-situ values), plus a computed value of the bulk modulus, the other elastic constants can be computed; these include compressibility, rigidity (shear) modulus, Poisson's ratio, and velocity of shear waves. Numerical examples are given of all computations. (Knapp-USGS)

PRELIMINARY INVESTIGATION OF THE URFICIAL SEDIMENTS IN THE CAP-BRETON CANYON (SOUTHWEST FRANCE) AND THE SURROUNDING CONTINENTAL HELF,
nstitut de Geologie du Bassin d'Aquitaine, Talence France).
eorge P. Allen, Patrice Castaing, and Andre lingebiel.
Marine Geology, Vol 10, No 5, p M27-M32, May 971. 6 p, 2 fig, 1 tab, 15 ref.

Descriptors: *Bottom sediments, *Glacial drift, Sampling, *Continental shelf, *Sedimentation, adioactive dating, Suspended load, Bed load, ilts, Clays, Sands, Sediment transport, Sedimenta- structures, Pleistocene epoch.
dentifiers: *Submarine canyons, *France, *Sedi-entary facies.

total of 120 grab samples of the surficial sedi-ents in the Cap-Breton, France, submarine anyon and surrounding continental shelf were col-cted and analyzed by grain-size sieving. A Q-ode Factor Analysis was made on the grain-size ata in order to define the most meaningful facies pes. Four distinct lithological facies were found exist: silt and clay, very fine sand, fine sand, and oarse sand. Comparison with previous work and a -14 date on the silt and clay facies showed that e facies are not contemporaneous. The sands and oarse sands on the shelf were emplaced during the re-Wurm and Wurm regressions, and later robably reworked during the Holocene (Flandri-n) transgression. The silty clays found in the anyon and on the shelf to the south are younger id represent sediments brought in as suspended ad by the Adour and other nearby rivers during e Holocene (Flandrian) transgression. HOLOCENE SEDIMENTATION IN THE STRAIT OF OTRANTO BETWEEN THE ADRIATIC AND IONIAN SEAS (MEDITERRANEAN),
Technische Hochschule, Munich (West Germany). Institut fuer Geologie; and Technische Hochschule, Munich (West Germany). Dept. of Marine Geology and Sedimentalogy.
R. Hesse, U. Von Rad, and F. H. Fabricus.
Marine Geology, Vol 10, No 5, p 293-355, May 1971. 63 p, 23 fig, 78 ref, 3 append.

Descriptors: *Bottom sediments, *Sedimentary structures, *Stratigraphy, Continental shelf, Continental slope, Benthos, Geomorphology, Provenance, Sedimentation, Particle size, Mineralogy, Turbidity currents, Sediment transport.
Identifiers: *Mediterranean, *Adriatic Sea, *Ionian Sea.

An extensive radiograph study of 24 undisturbed, up to 206-cm long, box and gravity cores from the western part of the Strait of Otranto revealed a great variety of primary bedding structures and secondary burrowing features. The regional distribution of the sediments according to their structural, textural, and compositional properties reflects the major morphologic subdivisions of the strait into shelf, slope, and trough bottom. The terrigenous components of the surface sediments as well as those of the deeper sand layers can be derived from the Apulian shelf and the Italian mainland (Cretaceous Apulian Plateau and Gargano Mountains, southern Appenines, volcanic province of the Monte Vulture). Indicated by the heavy mineral glaucophane, a minor proportion of the sedimentary material is probably of Alpine origin. If this portion is considered to be first-cycle clastic material it recahes the Strait of Otranto after a longitudinal transport of 700 km via the Adriatic Sea. The lack of phyllosilicates in the coarse- to medium-grained shelf samples might be explained by the activity of the 'Apulian Current' (surface velocities up to 4 knots) which in the past possibly has affected the bottom almost down to depths of the shelf edge. The percentage of planktonic organisms, and also the plankton: benthos ratio in the sediments is a useful indicator for bathymetry (depth zonation). (Knapp-USGS)

SKEWNESS AS AN ENVIRONMENTAL INDICATOR IN THE SOLANI RIVER SYSTEM, ROORKEE (INDIA),
Oil and Natural Gas Commission, Ahmedabad (India).
A. K. Awasthi.
Sedimentary Geology, Vol 4, No 2, p 177-183, June 1970. 7 p, 2 fig, 1 tab, 10 ref.

Descriptors: *Particle size, *Alluvial channels, *Sediment transport, *Deposition (Sediments), *Sedimentation, *Statistical methods, Statistics, Frequency analysis, Distribution patterns, Bed load, Suspended load, Channel morphology, Meanders.
Identifiers: *India.

All of the grain-size parameters of terrigenous sediments, the sign of skewness is the most sensitive to environmental conditions of deposition. The sediments, skewed negatively at the river confluences and the upstream parts of meanders are indicative of turbulent energy conditions in the depositing medium. The positively skewed sediments at the downstream parts of meanders and the straighter parts of the river system, point to a calm and steady energy environment of sedimentation. However, the skewness value is not correlatable with the changes in the energy of the depositing medium. It is only the sign of skewness that indicates the state and the nature of the energy of the depositional agent. (Knapp-USGS)
W71-09123

SIGNIFICANCE OF PEBBLE SIZE AND SHAPE IN SORTING BY WAVES,
Nature Conservancy, Wareham (England). Furzebrook Research Station.
A. P. Carr, R. Gleason, and A. King.
Sedimentary Geology, Vol 4, No 2, p 89-101, June 1970. 13 p, 4 fig, 3 tab, 16 ref.

Descriptors: *Beaches, *Particle size, *Particle shape, *Waves (Water), *Sediment transport, Regression analysis, Sampling, Statistical methods, Erosion, Surf, Density, Bed load, Deposition (Sediments).
Identifiers: Sorting (Sediments), Grading (Sediments).

Means, standard deviations and standard errors are compared for length, breadth, thickness and weight of samples 500 quartzite and flint/chert pebbles from six beach crest sites on the shingle beach at Chesil Beach, Dorset, England. Because of the conditions prevailing, grading alongshore is especially well developed. The data are used in examining various shape ratios and indexes including LUTTIG's sigma and pi, the WENTWORTH-CAILLEUX flatness index, KRUMBEIN's sphericity index, and the maximum projection index of SNEED and FOLK. The only comparable dimension or index between the quartzite and flint/chert population is thickness. Since the specific gravity of both lithological types is the same it would appear that over the range of pebble sizes and shapes on this beach, thickness is the critical dimension in determining the overall sorting of pebbles by wave action. (Knapp-USGS)
W71-09124

DISTRIBUTION AND THICKNESS OF QUATERNARY SEDIMENTS IN THE LAKE CONSTANCE BASIN,
Heidelberg Univ. (West Germany). Sediment Research Lab.; and Dalhousie Univ., Halifax (Nova Scotia). Dept. of Geology.
German Muller, and Rudolf A. Gees.
Sedimentary Geology, Vol 4, No 1, p 81-87, Mar 1970. 7 p, 5 fig, 5 ref.

Descriptors: *Sedimentation, *Seismic studies, *Bottom sediments, *Lakes, *Distribution patterns, Glaciers, Geomorphology, Lake morphology, Lake basins, Lake beds, Topography, Surveys.
Identifiers: *Lake Constance (Germany).

Distribution and thickness of Pleistocene and Holocene sediments are derived from a continuous seismic reflection survey of the Lake Constance Basin. The sediment distribution within the lake confirms the concept that the Lake Constance Basin has been formed by glacial erosion rather than by structural deformation. (Knapp-USGS)

LONGITUDINAL DUNES OF THE NORTHWESTERN EDGE OF THE SIMPSON DESERT, NORTHERN TERRITORY, AUS-

TRALIA, 1. GEOMORPHOLOGY AND GRAIN SIZE RELATIONSHIPS,
Texas Univ., Austin, Dept. of Geological Sciences.
Robert L. Folk.
Sedimentology, Vol 16, No 1-2, p 5-54, Mar 1971. 50 p, 16 fig, 1 tab, 183 ref.

Descriptors: *Dunes, *Deserts, *Sediment transport, *Aeolian soils, *Particle size, Sedimentary structures, Wind erosion, Statistical methods.
Identifiers: *Sorting (Sediments), *Simpson Desert (Australia).

Origin of the longitudinal dune form is reviewed. The spectacular longitudinal dunes of the Simpson desert are caused by helicoidal wind flow of the prevailing south-southeastern winds, acting upon ancient alluvial plains. Critical in this theory is the evidence from 'tuning-fork' dune junctures, which open upwind as do similar features in other geologic realms of primarily one-directional currents undergoing second-order helicoidal circulation. Review of previous work on using grain size to distinguish beach from dune sands reveals the consistent good sorting and positive skewness of coastal dunes. Simpson desert dunes are also positively-skewed, but are not as well sorted as coastal dunes because they are only recently derived from poorly-sorted alluvial source sediments. Dune crests are coarsest and best sorted because they are made out of the most easily saltated fine sand (about 2.5 ph); windward flanks, leeward flanks, and reg are progressively finer and also show regular and explainable changes in the higher-order grain-size parameters. Both dune and reg sediments are polymodal mixtures, giving rise to a 'quantum theory' of aeolian deposition. (Knapp-USGS)

TURBIDITIES OF THE NORTHEAST PACIFIC,
Lamony-Doherty Geological Observatory, Palisades, N.Y.
D. R. Horn, M. Ewing, M. N. Delach, and B. M. Horn.
Sedimentology, Vol 16, No 1-2, p 55-69, Mar 1971. 15 p, 5 fig, 1 tab, 40 ref. Naval Ship Systems Command Contract N00024-67-C-1184; ONR Contract N00014-67-A-0108-0004; NSF Grant NSF-GA-1193.

Descriptors: *Bottom sediments, *Turbidity currents, *Sediment transport, *Pacific Ocean, Sands, Continental slope, Density currents, Suspended load, Bed load, Particle size, Sedimentary structures, Deposition (Sediments), Silts, Clays.
Identifiers: Grading (Sediments).

The northeast corner of the Pacific Ocean is a region of turbidity-current activity. Cores from this area are dominated by very fine-grained sand and medium-grained silt that grade upward to clay. This paper is based on 217 textural analyses of turbidite layers comprising 30 piston cores. It is possible to distinguish proximal and distal facies of turbidites using characteristics of layering, grading and texture. Features of the proximal facies include wide range of layer thickness, maximum layer thickness, non-grading, truncation of grading, textural reversals, and sand at the base of graded layers. Areas beyond main routes of submarine flows are sites of episodic addition of silt-through clay-sized sediment. The proportion, thickness, and mean grain size of the silt decreases with increasing distance from the main avenues of flow. (Knapp-USGS)

A COARSE-GRAINED POCKET BEACH COMPLEX, TANAFJORD (NORWAY),
Oxford Univ. (England). Dept. of Geology and Mineralogy.
D. K. Hobday, and N. L. Banks.
Sedimentology, Vol 16, No 1-2, p 129-134, March 1971. 5 p, 5 fig, 2 ref.

Descriptors: *Beaches, *Particle size, *Particle shape, *Gravels, *Sediment transport, Surf, Sedimentation, Shores, Sedimentary structures.
Identifiers: *Pocket beaches, *Norway, Sorting.

The bulk of the material of the pocket beach at the mouth of the Manndraperely, Tanafjord, northern Norway, is supplied by the river. The stream bed consists of poorly sorted coarse sediments which show a crude upstream imbrication. Dampening of wave activity near the mouth of the stream by the outflow of water caused relatively fine-grained material to accumulate on spits. Size-shape sorting by waves concentrates the finest pebbles on landward moving swash bars. Away from the stream mouth beach deposits become finer grained landward, and are zoned in a manner that might be confused with coarse-grained fluviatile sequences. Study of the textures of the Manndrapereiv deposits establishes criteria for distinguishing between these two possibilities. (Knapp-USGS)

BREAK OF SLOPE IN PARTICLE-SIZE CURVES OF GLACIAL TILLS,
Durhan Univ. (England). Dept. of Geography.
Peter Beaumont.
Sedimentology, Vol 16, No 1-2, p 125-128, March 1971. 4 p, 1 fig, 1 tab, 1 ref.

Descriptors: *Particle size, *Glacial drift, *Till, *Sieve analysis, *Sands, Gravels, Frequency analysis, Statistical methods, Distribution patterns, Provenance.
Identifiers: *Particle size analysis, *England.

In studies of particle-size distribution of the less than 20-mm fraction of glacial clays in eastern Durham, England, one particular characteristic seems common to them all; when the particle-size data obtained by sieving and hydrometer analysis are plotted on semi-logarithmic graph paper almost all the curves are made up of two shallow concave or straight sections separated by a small section of varying convexity. This convexity or marked break of slope is nearly always found in the range 0.2-0.8 mm. The break of slope shows that the material in the finer grain sizes is more abundant than the coarser material, and that there is a change in the nature of the sediment from a dominance of rock fragments to one of mineral grains. Therefore, the break of slope is obviously related to local parent material, and probably reflects the wearing effect of the ice on the rock frament included within it. In different areas it would seem likely that this break of slope in the particle-size curve of glacial tills would take place at different grain sizes and be a reflection of the dominant particle-size distribution of the parent material over which the ice was moving. In this case Carboniferous sandstones are considered to be the main parent material of the till sheet. (Knapp-USGS)

CORRELATION OF SEDIMENT CORES ON THE BASIS OF THEIR MAGNETIZATION,
Bundesanstalt fuer Bodenforschung, Hanover (West Germany).
Dietrich Heye.
Sedimentology, Vol 16, No 1-2, p 111-117, March 1971. 7 p, 6 fig, 5 ref.

Descriptors: *Bottom sediments, *Magnetic studies, *Cores, Sampling, Atlantic Ocean, Sedimentology, Sedimentation, Stratigraphy, Indian Ocean.
Identifiers: Magnetization (Sediments).

Sediment cores originating from the Indian and the Atlantic Ocean were investigated. The declination of the cores was measured non-destructively. In both regions it was possible to correlate several cores on the basis of their magnetization (intensity correlation in contrast to correlation of paleomagnetic reversals). Additional layers of turbidity-currents and a layer of volcanic material were detected. (Knapp-USGS)
W71-09285

SLUMPING ON A CONTINENTAL SLOPE INCLINED AT 1-4 DEGREES,
New Zealand Oceanographic Inst., Wellington. Dept. of Scientific and Industrial Research; and Victoria Univ., Wellington (New Zealand). Dept. of Geology.
K. B. Lewis.
Sedimentology, Vol 16, No 1-2, p 97-110, March 1971. 4 p, 4 fig, 1 tab, 35 ref.

Descriptors: *Landslides, *Continental slope, *Sedimentation, Turbidity currents, Mud, Sedimentary structures, Bottom sediments.
Identifiers: *Slumping.

Continuous seismic profiles from the upper continental slope east of North Island, New Zealand, show that surface sediment 10-50 m thick has slumped down bedding planes sloping at 1-4 deg. There are four slumps, the Kidnappers Slump which has an area of 250 sq km, the Paoanui Slump of 80 sq km, a small slump of only several square kilometers and a slump of undetermined extent. All occurred during the last 20,000 years in Last Glacial Age sediments. A glide plane is exposed at the head of each slump and beds are thrust or contorted at the toe of some slumps. Slumping was probably caused by the failure of loosely packed sandy silt during major earthquakes. (Knapp-USGS)

MICRITIC ENVELOPES OF CARBONATE GRAINS ARE NOT EXCLUSIVELY OF PHOTOSYNTHETIC ALGAL ORIGIN,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Geology; State Univ. of New York, Stony Brook. Dept. of Earth and Space Sciences; and Barnard College, New York. Dept. of Geology.
Gerald M. Friedman, Conrad D. Gebelein, and John E. Sanders.
Sedimentology, Vol 16, No 1-2, p 89-96, March 1971. 7 p, 27 ref.

Descriptors: *Carbonate rocks, *Sedimentary structures, *Algae, *Paleohydrology, *Sedimentation, Sedimentology, Stratigraphy, Limestones, Marl, Chemical precipitation, Deposition (Sediments), Biochemistry.
Identifiers: *Micrite.

Micritic envelopes are commonly believed to develop from the lime-mud infillings of circumferential perforations made in skeletal particles by algae. Because 'algae' are usually taken to mean photosynthetic algae, it has been proposed that micritic envelopes would not appear on carbonate skeletal particles originating in waters too deep for active growth of photosynthetic algae. This depth limiting concept of the origin of micritic envelopes is challenged for two reasons: (1) petrographic study of a large number of thin sections thought to be representative of various paleo-depth levels does not indicate any systematic variations in the preservation of the outlines of skeletal particles and (2) molluscan skeletal debris displaying micritic envelopes and effects of borings identical with those generally ascribed to the activities of photosynthetic algae were found in an aragonite cemented sandstone from the Atlantic shelf where geologic evidence indicates that the water at time of boring was too deep for active growth of photosynthetic algae. Organisms other than photosynthetic algae can bore into calcareous materials. In particular, fungi, bacteria, and heterotrophic algae (whose distribution does not depend on the penetration of light into seawater) are known to be active borers. (Knapp-USGS)

NUMERICAL ESTIMATES OF ANCIENT WAVES, WATER DEPTH AND FETCH,
Florida State Univ., Tallahassee. Dept. of Geology.
William F. Tanner.
Sedimentology, Vol 16, No 1-2, p 71-88, March 1971. 8 p, 1 fig, 4 tab, 11 ref.

escriptors: *Sedimentary structures, *Ripple arks, *Particle size, *Waves (Water), *Regression analysis, Currents (Water), Paleohydrology, ceanography, Lakes.
dentifiers: *Sorting (Sediments).

series of carefully controlled marine experients, in which sand of known grain diameter and ssentially perfect sorting was exposed to waves of arious sizes, was supplemented by study of lakes various widths (and hence differing values for tch), in an effort to obtain relationships between arameters measurable in sedimentary rocks (i.e., pple-mark spacing) and paleogeographic infor-ation (water depth, wave height, wave length, d fetch). Regression equations were obtained, lating ripple-mark spacing to grain size, water ave-length, water depth, and water wave-height. general those based on water wave-length were perior to those based on water wave-height. In allow water, the values which can be obtained om these equations are highly limited in range, d thus define the palegeographic unknowns asonably closely. These values can be inserted to three additional equations, which relate fetch various wave parameters. (Knapp-USGS)

EASUREMENTS OF THE ENGINEERING OPERTIES OF MARINE SEDIMENTS,
val Academy, Annapolis, Md. Dept. of Ocean gineering.
T. Monney.
arine Technology Society Journal, Vol 5, No 2, p -30, March-April 1971. 10 p, 41 ref.

scriptors: *Bottom sediments, *Shear strength, strumentation, *Mechanical properties, *On-e testing, Coastal engineering, Civil engineering, gineering geology, Foundation investigations.
ntifiers: Marine sediments.

truments currently used to measure engineering operties of marine sediments in situ are evaluated h respect to actual performance and required curacies. The inherent difficulties of measuring se properties in the laboratory rather than in situ reviewed, and test results are provided which icate existing sampling devices and procedures oduce questionable results. Measurement of ar strength of sediments is of particular interest ngineers, and development of an in situ direct ar device is recommended. A bore-hole direct-shear device which measures the internal angle of friction and cohesion from inside bored holes is under development. The device is a split cylinder with horizontal knife edges which is hydraulically loaded within a bore hole in a radial direction. When the sediment is consolidated under an increment of load the cylinder is pulled until shear failure occurs. Additional loads and pulls provide a measure of shear strength under increasing normal stress. Tests on sand, loam, silt and clay demonstrate close agreement between in situ tests and laboratory triaxial and direct shear tests. With modifications it should be feasible to utilize the device for measuring the shear strength of marine sediments. (Knapp-USGS)

INTERAGENCY APPROACH TO WATERSHED PROBLEMS OF EEL RIVER,
California State Dept. of Water Resources, Red Bluff. Northern District.
Eugene F. Serr.
Proceedings of the American Society of Civil Engineers, Journal of the Irrigation and Drainage Division, Vol 97, No IR-1, Paper 7983, p 181-192, March 1971. 12 p, 2 fig, 2 tab, 8 ref.

Descriptors: *Sediment yield, *California, *Erosion, *Suspended load, Provenance, Landslides, Stream erosion, Gully erosion, Sediment control, Erosion control, Water quality control.
Identifiers: *Eel River (Calif).

Watershed studies in the Eel River basin, California, are summarized. The U. S. Geological Survey estimated the long-term average suspended sediment load near the mouth at 7,400 tons per sq mile of drainage area. Among larger rivers of the world, this figure is known to be exceeded only by the Yellow River of China and certain of its tributaries, and the Semani River in Albania. The U. S. Soil Conservation Service found that the principal sediment sources in the basin were streambank erosion (54%), landslides (26%), and sheet and gully erosion (10%). The maximum feasible sediment reduction through land treatment measures was estimated at about 20%. Active and intensive watershed management can be expected in the future in problem areas in the Eel River basin as measures such as cover manipulation become economically feasible and more is learned about wildland water quality and quantity control. (Knapp-USGS)
W71-09292

NET KINETIC ENERGY IN LITTORAL TRANSPORT,
Florida State Univ., Tallahassee. Dept. of Geology.
William F. Tanner.
Science, Vol 172, No 3989, p 1231-1232, June 18, 1971. 2 p, 5 ref.

Descriptors: *Kinetics, *Sediment transport, *Littoral drift, *Beach erosion, Coastal engineering, Shore protection, Soil management, Gulf of Mexico, Florida.
Identifiers: *Net Kinetic energy, *Littoral transport, Coastal management.

Studies of coastal erosion and coastal management are discussed. Studies can be put on a firm physical basis after methods are developed for closely estimating the energy expended in actual unidirectional net littoral transport of sediment. Such measures have been obtained for six coastal drift cells. The results, for a 68-year period, vary from a minimum of 0.6 X 10 to the 4th power ergs (very low energy) to a maximum of 340 X 10 to the 4th power ergs (moderately high energy) per cell. Data are analyzed for the Gulf of Mexico southwest of Tallahassee, Florida, and include the mass volume of sand moved, the distance moved, and the time interval covered. (Lang-USGS)
W71-09298

THE SEDIMENT ON THE FLOOR OF THE SOUTHERN IRISH SEA,
University Coll. of Wales, Aberystwyth. Dept. of Geology.
M. R. Dobson, W. E. Evans, and K. H. James.
Marine Geology, Vol 11, No 1, p 27-69, June 1971. 43 p, 10 fig, 74 ref, append.

Descriptors: *Bottom sediments, *Tidal effects, *Sediment transport, *Sand waves, *Currents (Water), Sampling, Data collections, Deposition (Sediments), Sedimentary structures, Ripple marks, Sands, Carbonates, Particle size, Provenance, Tides, Water circulation.
Identifiers: *Irish Sea.

The southern Irish Sea was surveyed using Asdic, continuous reflexion profiling, echo sounding, and bottom samples. The results are presented in the form of a sediment facies chart. Some of the major sea-bed features were interpreted using seismic data. Bed forms, principally sand waves, sand ribbons and sand streams, were identified and their hierarchical associations established; these have provided insight into the patterns of sediment circulation. The form of these patterns is directly under the control of the tidal regime (which, in the southern Irish Sea, is the reverse of that normally found around British coasts). Along the Irish coast the tidal form consists of high velocities associated with negligible range: on the Welsh side low velocities and a pronounced range are the usual association. The effects of these tidal peculiarities on the sediment are to create a bedload separation on the Irish shelf, and a coalescence on the Welsh side. The sub-littoral sands are essentially quartzose with a strongrock debris component, carbonate contents being generally low (5%). Offshore and in mid-channel, there is a variable carbonate component which is bidmodal as a result of whole shell imposition. Macrofauna communities, broadly defined in association with bottom characteristics, illustrate relationships between source material and detrital organogenic sediment. (Knapp-USGS)
W71-09305

DIFFERENTIAL EROSION OF CARBONATE-ROCK TERRANES,
Geological Survey, Raleigh, N.C.; and Geological Survey, Washington, D.C.
H. E. Le Grand, and V. T. Stringfield.
Southeastern Geology, Vol 13, No 1, p 1-17, May 1971. 17 p, 3 fig, 28 ref.

Descriptors: *Geomorphology, *Erosion, *Carbonate rocks, *Karst, *Limestones, Weathering, Leaching, Topography, Water chemistry, Residual soils, Soil water, Soil formation, Vegetable effects, Groundwater.
Identifiers: *Karst topography, *Carbonate-rock topography.

Relief in carbonate-rock terranes may be local and small as expressed by many shallow sinkholes, or large as expressed by poljes and escarpments. In addition to relief within the karst terrane, there is commonly significant relief between a belt of carbonate rocks and an adjacent belt of noncarbonate rocks. Erosion in carbonate terranes is favorable under moderate rather than under extreme conditions of cover, purity of the carbonate rock, topographic relief, and precipitation. Denuded carbonate rocks are much more resistant to physical and chemical erosion than are carbonate rocks with a moderately thin soil and vegetal cover; where the soil and rock cover is very thick, physical erosion of the covered bed is impossible and chemical erosion may be retarded because of retarded water circulation. Pure carbonate rocks yield no insoluble residue to form a cover; also, intense precipitation tends to strip off a thin cover and to keep the rock denuded. If the carbonate rocks are relatively impermeable, water cannot easily penetrate rock to aid soil development. Thus, the degree of cover on a carbonate terrane is an important key to differential erosion and to much of the topographic relief. (Knapp-USGS)
W71-09307

LITHOLOGY OF ROCKS DREDGED FROM THE BLAKE PLATEAU,
Virginia Polytechnic Inst., Blacksburg. Dept. of Geological Sciences.
Richard M. Pratt.
Southeastern Geology, Vol 13, No 1, p 19-38, May 1971. 20 p, 6 fig, 44 ref.

Descriptors: *Bottom sediments, *Continental slope, *Sampling, Surveys, Carbonates, Phosphates, Manganese, Chemical precipitation, Deposition (Sediments), Sedimentation, Sediment transport, Florida, Atlantic Ocean, Currents (Water), Water circulation.
Identifiers: *Gulf Stream, *Blake Plateau.

Dredge samples and photographs from the Blake Plateau, off the southeastern coast of the United States, were used to study the bottom material, which has both a sediment component and a rock component. Sediment is characteristically very well sorted foraminiferal sand except near the Bahama Banks where it is carbonate lutite. The rock fraction can conveniently be separated into limestone, coral, phosphate concretions and manganese concretions. Coral is most abundant beneath the axis of the Gulf Stream and owes its growth to a long-term equilibrium condition between sedimentation and erosion maintained by the currents. The coral helps to stabilize the bottom by trapping fine sediment. Phosphate nodules occur extensively from the slope to the other escarptment across the northern end of the Plateau, and in a small area off Miami, Florida. Manganese concretions are forming under present day conditions. The manganese concretions grow by replacement of phosphate nodules as well as by simple accretion. Their overall chemical composition is similar to that of deep-sea deposits. The Gulf Stream is the controlling environmental factor in the area and the distribution of all rocks and most fine sediment can be related to the current regime. (Knapp-USGS)
W71-09308

THE OFFSET COURSE OF THE ST. JOHNS RIVER, FLORIDA,
North Carolina Univ., Chapel Hill.
William A. Pirkle.
Southeastern Geology, Vol 13, No 1, p 39-59, May 1971. 21 p, 8 fig, 3 tab, 25 ref.

Descriptors: *Geomorphology, *Rivers, *Valleys, *Florida, *Karst, Limestones, Aquifers, Channels, Surface-groundwater relationships, Erosion, Discharge (Water), Topography, Springs.
Identifiers: *St. Johns River (Fla).

The northward-flowing St. Johns River is the dominant river in eastern peninsular Florida. At a point east of Sanford, Florida, the river turns toward the west to reach an older valley that it follows northward almost to Palatka before turning to the east to flow again over a younger terrain. The offset valley probably marks part of the course of an ancestral river. Factors believed to be important in the development of the valley include faulting and fracturing, solution of carbonate sediments, and favorable structures for artesian discharge. The preservation of the offset valley as a major stream course is due primarily to the discharge of large quantities of artesian water. Much of this discharge is made possible in the northern part of the offset area by the relatively permeable nature of the aquiclude and in the central and southern areas of the offset by the exposure of the aquifer. The numerous springs from Lake George southward mark sites where the aquifer is exposed or breached. (Knapp-USGS)
W71-09309

EXPERIMENTS ON THE ANGLES OF REPOSE OF GRANULAR MATERIALS,
Research Council of Alberta, Edmonton.
Maurice A. Carrigy.
Sedimentology, Vol 14, No 3/4, p 147-158, July 1970. 12 p, 5 fig, 5 tab, 4 ref.

Descriptors: *Slope stability, *Avalanches, *Sedimentary structures, Topography, Soil stability, Landslides, Sedimentation, Stratification, Dunes.
Identifiers: *Angle of repose (Sediments).

A simple apparatus for measuring the angles of repose of masses of granular material in various media is based on the rotating-drum principle. Two angles of repose are measured by this method. The critical angle of repose is defined as the angle through which a mass of granular material can be rotated before it fails by avalanching, and the angle of rest is defined as the inclination of the slope after avalanching has ceased. For materials with similar surface characteristics the angles of repose increase with departure of the grains from a spherical form. For masses of spherical particles the angles of repose increase with increasing intergranular friction caused by differences in surface characteristics. For mixtures of spheres and cubes the angles of repose are proportional to the volumes of the end members present. For natural quartz sands the critical angle of repose is always greater in air than under water, but the angle of rest is the same in both media. (Knapp-USGS)
W71-09314

THE TIDE-SWEPT CONTINENTAL SHELF SEDIMENTS BETWEEN THE SHETLAND ISLES AND FRANCE,
National Inst. of Oceanography, Wormley (England).
N. H. Kenyon, and A. H. Stride.
Sedimentology, Vol 14, No 3/4, p 159-173, July 1970. 15 p, 8 fig, 32 ref.

Descriptors: *Bottom sediments, *Sediment transport, *Continental shelf, Tides, Tidal effects, Tidal waters, Currents (Water), Bed load, Ripple marks, Littoral drift, Surveys, Sounding, Sampling, Acoustics.
Identifiers: *Tidal currents, *Irish Sea, Bristol Channel.

Extensive data obtained by side-scan Asdic and echo-sounder equipments, viewed in conjunction with bottom notations on navigational charts and some sea-bed samples, show the widespread occurrence of sand ribbons, sand waves and sand patches on the continental shelf west of the British Isles and France. The close similarity of their directional trends with those of the strongest tidal currents strongly suggests a causal relationship which applies to much of the continental shelf, parts of the upper continental slope and also to off-lying shoals such as Rockall Bank. The sand transport paths broadly parallel the coasts in the epicontinental seas and on the open shelf west of the British Isles. In contrast, the paths are substantially normal to much of the coast of western France. (Knapp-USGS)
W71-09315

PHREATIC VERSUS VADOSE METEORIC DIAGENESIS OF LIMESTONES: EVIDENCE FROM A FOSSIL WATER TABLE,
Texas Univ., Austin. Dept. of Geological Sciences.
Lynton S. Land.
Sedimentology, Vol 14, No 3/4, p 175-185, July 1970. 11 p, 6 fig, 2 tab, 14 ref. NSF Grant GA-901; ACS PRF 3395-A2.

Descriptors: *Diagenesis, *Limestones, *Groundwater movement, *Weathering, *Aeolian soils, Water table, Dunes, Infiltration, Calcium carbonate, Sands, Percolation, Soil water movement, Water chemistry, Sedimentation, Stratigraphy, Water levels, Water level fluctuations.
Identifiers: *Bermuda.

The Middle Pleistocene Belmont Formation of Bermuda consists in part of beach-dune biocalcarenites which underwent intense contemporaneous cementation and diagenesis. The beach deposits were contemporaneously cemented by fibrous isophacous cement to form beachrock, whereas previously deposited eolianites further inland underwent intense meteoric phreatic diagene sis, resulting in coarse-grained cementation and stabilization of most of the metastable component of the rock. Above the Belmont water table, vadose diagenesis was relatively ineffective in cementing and altering the biocalcarenites. Phreatic meteoric diagenesis is interpreted to be a very rapid process relative to vadose meteoric diagenesis, and to resul in a much coarser-grained sparite. (Knapp-USGS)
W71-09316

LATE PLEISTOCENE DIAGENESIS AND DOLOMITIZATION, NORTH JAMAICA,
Texas Univ., Austin. Dept. of Geological Sciences and California Inst. of Tech., Pasadena. Div. o Geological Sciences.
Lynton S. Land, and S. Epstein.
Sedimentology, Vol 14, No 3/4, p 187-200, July 1970. 14 p, 6 fig, 3 tab, 32 ref.

Descriptors: *Diagenesis, *Limestones, *Reefs *Carbonate rocks, *Coral, Algae, Water chemistry, Sea water, Dolomite, Rain water, Solubility, Calcite, Mineralogy, Equilibrium, Magnesium, Pleistocene epoch.
Identifiers: *Jamaica.

Diagenesis, including dolomitization, of Late Pleistocene reefs of North Jamaica is due to reaction with meteoric water. Although the reaction Mg-calcite to calcite, Aragonite to calcite, and Mg calcite to dolomite retain microarchitectural information, complete chemical redistribution take place so that incongruently dissolved Mg-calcites aragonite inversion mosaics (neomorphosed aragonite), and dolomitized red algae have simila isotopic compositions, resembling precipitated calcite cements. The minerals all appear to hav stabilized in the meteoric water environment. The dolomite is not widely distributed, and is restricted to replacement of red algae. There has been no ne addition of magnesium to the red algal clasts. (K napp-USGS)

EXPERIMENTAL STUDY OF THE SORPTION OF POTASSIUM BY MONTMORILLONITE,
Akademiya Nauk SSSR, Moscow. Geologicheski Institut.
V. I. Muravyov, and B. A. Sakharov.
Sedimentology, Vol 15, No 1/2, p 103-113, Oc 1970. 11 p, 3 fig, 1 tab, 12 ref.

Descriptors: *Clay minerals, *Montmorillonite *Ion exchange, *Diagenesis, *Potassium, Wate chemistry, Mineralogy, Clays, Silicates, Cation ad sorption.
Identifiers: Rectorite.

Experimental studies on saturation of montmori lonite with potassium showed that sorption o potassium tends to produce a regular alternation o the interlayer regions. The sorption nature of th potassium fixation by montmorillonite appears t form the basis of the epigenetic formation o rectorite. Comparison of the series of probabili curves indicates that as concentrations of K in crease, it is abosorbed in two phases with an obv ous tendency to fixation in interlayer regions i every second layer. The tendency to regular alter nation of montmorillonite and mica-like interlaye regions in rectorite-type minerals arises at earl stages of the process and is manifested in an 'orde red' interlayer sorption of cations. The progressiv development of this process in the sedimentary se ries logically concludes to the substitution of Al fo Si, primarily in layers already prepared for this by general concentration of a positive charge. (K napp-USGS)
W71-09319

FORMATION OF CARBONATE CEMENT IN CLASTIC ROCKS,
Akademiya Nauk SSSR, Moscow. Geologicheskii nstitut.
V. I. Muravyov.
Sedimentology, Vol 15, No 1/2, p 139-145, Oct 1970. 7 p, 3 fig, 5 ref.

Descriptors: *Diagenesis, *Calcite, *Carbonates, *Sandstones, Crystallization, Temperature, Pressure, Water chemistry, Magnesium, Iron, Clays minerals, Colloids, Aqueous solutions.
Identifiers: *Carbonate cements, Clastic rocks.

The texture of carbonate cement in clastic rocks reflects the conditions of: (1) free pore crystallization; or (2) recrystallization under elevated temperatures and pressures. Fibrous carbonate cement may be formed as a result of preferential adsorption of clay particles or colloids in the direction perpendicular to c. Cryptocrystalline carbonate cement is formed in sandstones if the ratio of carbonate to argillaceous matter is less than 5 (for montmorillonite) or less than 3-4 (for illite). The maximum amounts of isomorphic admixtures of Mg and Fe in calcite cement can be used for temperature reconstructions of the epigenetic environment. In deep-buried rocks, which are almost closed systems, migration rates are lower than diffusion rates. Microenvironments of detrital grain corrosion may exist adjacent to those of precipitation of the same mineral. (Knapp-USGS)

THE ORIGIN AND SIGNIFICANCE OF SAND VOLCANOES IN THE BUDE FORMATION CORNWALL),
Oxford Univ. (England). Dept. of Geology and Mineralogy.
R. V. Burne.
Sedimentology, Vol 15, No 3/4, p 211-228, Dec 1970. 18 p, 12 fig, 2 tab, 13 ref.

Descriptors: *Sand boils, *Sediments, *Deposition (Sediments), *Quicksand, *Compaction, Permeability, Pressure, Flow, Porous media, Subsidence.
Identifiers: *Sand volcanoes, *Fluidized sands.

Sand volcanoes are found in three sedimentary associations in the Upper Carboniferous Budge Formation. In two of these associations they formed when the dewatering of fluidized sand beds was temporarily inhibited by the deposition of overlying units. In the third association the volcanoes formed during the normal post-depositional compaction of fluidized, muddy, poorly sorted units deposited from subaqueous mudflows. The tops of fluidized sand beds were characteristically sheared by a fairly powerful current immediately after being deposited, while the waters above the recently deposited mudflow units were commonly stagnant, allowing sand volcano formation. MINERAL STUDIES IN THE GRAVITATION-GRADIENT FIELD: 1. THE METHOD,
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut.
M. Ya. Katz.
Sedimentology, Vol 15, No 1/2, p 147-159, Oct 1970. 13 p, 4 fig, 1 tab, 18 ref.

Descriptors: *Density, *Mineralogy, *Instrumentation, *Bouyancy, *Hydrometry, Specific gravity, Temperature, Separation techniques.

New equipment is described for investigating the density properties of minerals and rocks. A description is given of the principle and operation of a liquid density-gradient tube, of density standards and of a device for the precise determination and separation of minerals. The possibility of using the method described for geological and mineralogical studies is discussed. (See also W71-09323) (Knapp-USGS)

MINERAL STUDIES IN THE GRAVITATION-GRADIENT FIELD: 2. CHANGES OF QUARTZ SAND DENSITY DUE TO NATURAL AND EXPERIMENTAL 'MATURATION',
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut.
M. Ya. Katz, M. M. Katz, and A. A. Rassakazov.
Sedimentology, Vol 15, No 1/2, p 161-177, Oct 1970. 17 p, 7 fig, 4 tab, 9 ref.

Descriptors: *Sedimentation, *Abrasion, *Quartz, *Sands, *Density, *Weathering, Erosion, Scour, Instrumentation, Silica, Mineralogy, Crystallography.
Identifiers: Quartz sand.

Studies of natural quartz and laboratory experiments on mechanical and chemical destruction of quartz show that the statistical density characteristics of detrital quartz change during sedimentary processes. Grains with defective structure, gas-liquid inclusions, inclusions of organic matter and other lighter minerals have lesser densities, whereas grains with inclusions of heavier minerals have larger densities than those of optically pure grains. The susceptibility to destruction is less for optically pure grains than for grains with lower or higher density. This is responsible for the increasing maturity of quartz sand during weathering and transport as indicated by the increasing percentage of optically pure grains. Mathematical modelling of the dynamics of this process was carried out. (See also W71-09322) (Knapp-USGS)

CHEMICAL CHARACTERISTICS OF PRECIPITATION IN THE CHAMPLAIN VALLEY,
Vermont Univ., Burlington. Dept. of Zoology.
E. B. Henson.
Available from the National Technical Information Service as PB-200 167, $3.00 in paper copy, $0.95 in microfiche. Completion Report, June 1971. 10 p, 5 tab, 1 ref. OWRR Project A-007-VT (1).

Descriptors: *Precipitation (Atmospheric), Calcium, Sodium, Magnesium, Potassium, Chloride, Sulfate, Vermont, *Ions, *Champlain Valley.

More than 1000 precipitation water samples were collected from a number of stations in the Champlain Valley, and six ions were measured (Ca, Na, Mg, K, Cl, SO sub 4). As anticipated, considerable variation existed between rains, and between stations. Concentrations were generally higher in urban locations than in rural stations. The median concentration for all samples were: Ca, 1.25; Na, 0.28; Mg, 0.20 K, 0.19; Cl, 1.7; and SO sub 4, 1.9 mg/l. When concentrations were examined on a seasonal basis, higher concentrations were observed during the winter months with the exception of SO sub 4 which was lowest in the winter. The median monthly loads in kg/km sq were: Ca, 99; Na, 36, Mg, 15, K, 21; Cl, 134; and SO sub 4, 147 kg/km sq. Precipitation brings down about 450 kg/km sq/month. The concentrations of the six ions, when compared with a high elevation mountain pond, indicate more Cl in rainfall than in the pond water.

PRECIPITATION, ITS CHEMICAL COMPOSITION AND EFFECT ON SOIL WATER IN A BEECH AND A SPRUCE FOREST IN SOUTH SWEDEN,
Lund Univ. (Sweden). Dept. of Plant Ecology.
Bengt Nihlgard.
Oikos, Vol 21, No 2, p 208-217, 1970. 10 p, 7 fig, 4 tab, 27 ref.

Descriptors: *Water chemistry, *Rainfall, *Forests, Leaching, Soil water, Infiltration, Throughfall, Stem flow, Interception, Nutrients, Aerosols, Sampling.
Identifiers: *Sweden.

The quantitative distribution and the chemical composition of the rainfall in a 100-year old beech forest and a neighboring 55-year old planted spruce forest are reported. Average annual values of throughfall, stem flow and interception are estimated as 70%, 11%, and 19% for the beech forest and 58%, 3%, and 39% for the spruce forest of the incident rainfall in an open field. The soil of the spruce forest is about 19% drier than that of the beech forest, because of high interception and long transpiration period of the former forest. The following chemical features are discussed: pH, conductivity, amounts of Na, K, Ca, Mg, Mn, Cl, SO4-S, PO4-P and tot.-N. Extrapolated annual values of nutrients in the throughfall plus stem flow amount to 107 kg/ha and 215 kg/ha in the beech and the spruce forests respectively. A high percentage of the nutrients must derive from dry deposited aerosols, particularly for Na, Mg, Cl and Ca. The higher amounts of nutrients in the rainfall of the spruce forest probably derived from stronger leaching processes in the canopy. (Knapp-USGS)

VARITATIONS IN DELTA S-34 IN SULFATES OF RECENT AND OLD SEA BASINS OF THE USSR (Russian: Variatsii del'ty S-34 v sul'fatakh sovremennykh i drevnikh morskikh vodoyemov Sovetskogo Soyuza),
Vsesoyuznyi Neftyanoi Nauchno-Issledovatelskii Geologorazvedochnyi Institut, Leningrad (USSR).
N. A. Yeremenko, and R. G. Pankina.
Geokhimiya, No 1, p 81-91, Jan 1971. 11 p, 3 fig, 3 tab, 18 ref.

Descriptors: *Sulfur, *Geochemistry, *Sedimentary basins (Geological), *Geologic time, *Stable isotopes, Stratigraphy, Sea water, Radioactive dating, Oceans, Sulfates, Sediments, Rocks, Anhydrite.
Identifiers: *USSR, Russian Platform, Caspian Sea, Black Sea, Evaporites, Peneplanation, Isotopic composition.

Changes in the isotopic composition of the sulfur of evaporites in a cross section of a sedimentary stratum of the USSR have the same trend as in other regions of the globe and strengthen the supposition that the isotopic composition of sulfur in sulfates of the world's oceans changes in the course of geologic time. A change in the isotopic composition of the sulfur of oceans is due to the interaction of three basic factors: (1) supply of sulfur enriched in S-34 from the depths of the earth; (2) microbiological fractionation of sulfur isotopes in oceans and on land (secondary sulfates); and (3) loss of sulfur enriched in S-32 during peneplanation of continents. The average isotopic composition of sulfur of the earth's crust as compared with sulfur of chondrites shows a 15-20% shift in the direction of S-34. A regular change in the isotopic composition of the sulfur of evaporites in a cross section of a sedimentary stratum may be used for determining the stratigraphic affiliation of sulfate-containing rocks. (Josefson-USGS)

RESULTS OF A STUDY OF ORGANIC MATTER IN GROUNDWATERS OF KAMCHATKA (Russian: Rezul'taty izucheniya organicheskikh veshchestv v podzemnykh vodakh Kamchatki),
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
Ye. L. Bykova, G. A. Goleva, and Z. B. Dekusar.
Geokhimiya, No 2, p 225-237, Feb 1971. 13 p, 4 fig, 5 tab, 12 ref.

Descriptors: *Organic matter, *Groundwater, *Thermal water, *Rocks, Geochemistry, Water chemistry, Water analysis, Hydrogeology, Adsorption, Infiltration, Chromatography, Solvents.
Identifiers: *USSR, *Kamchatka, Mineralization.

A relationship was established between the organic matter composition of the groundwater of Kamchatka and the geochemical conditions of groundwater formation and composition of water-bearing rocks. The relationship between water-bearing rocks and the organic matter dissolved in groundwater is expressed by the leaching of organic matter from the rocks and by the adsorption of organic matter on the rocks. Experimental field studies show that it is possible to use data on the organic component of groundwater for determining groundwater genesis. A study of the composition of organic matter in widespread nitrogen thermal waters of Kamchatka confirms their infiltration origin. (Josefson-USGS)

GEOCHEMICAL DISTRIBUTION PATTERNS AND MIGRATION FORMS OF GOLD IN NATURAL WATERS (RUSSIAN: GEOKHIMICHESKIYE ZAKONOMERNOSTI RASPROSTRANENIYA I FORMY MIGRATSII ZOLOTA V PRIRODNYKH VODAKH),
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
G. A. Goleva, V. A. Krivenkov, and Z. G. Gudz'.
Geokhimiya, No 6, p 744-757, June 1970. 14 p, 5 fig, 6 tab, 15 ref.

Descriptors: *Gold, *Water chemistry, *Geochemistry, Thermal water, Connate water, Mineralogy, Chemical precipitation, Hydrogen ion concentration, Oxidation-reduction potential, Alkalis (Bases), Volcanoes, Sulfides, Organic matter.
Identifiers: *USSR, Transbaykal, Central Asia, Ural Mountains, Kamchatka, Dispersion halos, Fumaroles, Mineralization, natural water, Hydrogeochemistry.

Aqueous dispersion halos of the gold deposits of Eastern Transbaykal, Central Asia, Southern Urals and Kamchatka are largely the product of sulfuric acid, carbonic acid and hydrolytic decomposition of gold-containing minerals. The gold content in aqueous halos varies between 0.05 and 10 micrograms/liter. In natural waters with a pH of 5-8 and Eh of 0.1-0.5 volts, gold migrates in the form of uncharged particles and complex organic compounds. In the presence of thiosulfate ions gold may form extremely stable thiosulfate complexes. Chloride and bromide complexes of gold can be formed only in strongly acidic waters with an Eh greater than 0.9 volts and a pH of less than 1. Under natural conditions these types of waters are found only in hydrochloric-acid fumaroles of active volcanoes. A sulfuric acid medium is unfavorable for the migration of gold; thus, the gold content in interstitial waters of intensively oxidized gold-sulfide deposits does not exceed 0.1-0.15 micrograms/liter. Judging from the composition of new formations of gold deposits in the supergene zone and from correlations with other chemical elements in natural waters, the most common coprecipitators of gold are iron hydroxides, calcium carbonate, disulfides and colloidal silicic acid. (Josefson-USGS)

Geokhimiya, No 6, p 678-692, June 1970. 15 p, 8 fig, 5 tab, 32 ref.

Descriptors: *Igneous rocks, *Water chemistry, *Chemical analysis, *Aqueous solutions, Geochemistry, Petrography, Alkali metals, Hydrogen ion concentration, Alkalinity, Acidity, Silica, Chlorides, Calcium.
Identifiers: *USSR, *Georgian SSR, Hydrothermal solutions.

An examination is made of the interaction of water and various aqueous solutions with volcanic rocks collected in the Georgian SSR and with artificial glasses prepared from the rocks at temperatures of 200 deg and 300 deg C and 300 atm. The relative decomposition rate for acidic and basic igneous rocks exposed to water and chloride solutions of sodium, potassium and calcium is approximately the same and decreases for basic solutions. The total concentration of the solution obtained after interaction with the rocks increases as the solution changes from water to chloride and thence to basic solutions. Silica-saturated solutions result from interaction of water with volcanic rocks containing amorphous glassy material. The principal components of rocks entering neutral and basic solutions are silica and alkalis; alumina, iron and magnesium are generally only slightly mobile and are accumulated in the residual solid phase. Volcanic rocks in interaction with basic solutions assume a buffer role: the pH of the end solutions approaches 7.0 and does not deviate from neutral by more than 2-3 units. (Josefson-USGS)
W71-09120

HYDROGEOCHEMISTRY OF SEDIMENTARY (INTERSTITIAL) BRINES OF SALT DEPOSITS (RUSSIAN: K GIDROGEOKHIMII SEDIMENTATSIONNYKH RASSOLOV SOLYANYKH MESTOROZHDENIY),
G. V. Bel'tyukov.
Geokhimiya, No 9, p 1131-1135, Sept 1970. 5 p, 1 fig, 4 tab, 13 ref.

Descriptors: *Brines, *Salts, *Geochemistry, Chemical analysis, Saline water, Magnesium, Chlorine, Calcium, Potassium, Specific gravity.
Identifiers: *USSR, Hydrogeochemistry, Salt deposits, Mineralization, Bromine.

The composition of brines of several rock salt and potassium deposits of the USSR is examined. Although sedimentary (interstitial) brines represent partially metamorphosed brines, their chemical composition in the various deposits is basically the same. All brines are of the chloride type and have a high mineralization, a high specific gravity, high magnesium and bromine contents, and a low sodium content with respect to contact leaching brines. The calcium content is directly dependent upon the degree of brine metamorphism. The presence of iron and lithium is typical of the interstitial brines of some deposits. The brines often contain methane, hydrogen sulfide and nitrogen gases. The intraformational waters of salt rocks examined are, by their nature and formation conditions, buried sedimentary (Interstitial) brines. (Josefson-USGS)

SIMULATION OF TIDAL MOTION IN COMPLEX RIVER SYSTEMS AND INLETS BY A METHOD OF OVERLAPPING SEGMENTS,
Department of Energy, Mines and Resources, Ottawa (Ontario). Marine Sciences Branch.
R. F. Henry.
Department of Energy, Mines and Resources, Marine Sciences Branch Manuscript Report Series No 17, 1971. 30 p, 11 fig, 4 ref.

Descriptors: *Tidal waters, *Water circulation, *Tides, *Water level fluctuations, *Inlets (Waterways), *Model studies, Numerical analysis.

Analytical techniques, Turbulent flow, Turbulent boundary layers, Coasts, Rivers, Oceans, Breakwaters.
Identifiers: *Tidal motion.

A method is proposed to facilitate digital and hybrid computation of tidal motions for a coastal inlet or river system in which there are many bifurcations, confluences, islands, etc. The inlet is divided into overlapping segments and the tidal motion is computed for each segment separately over a time increment short enough to ensure that errors due to neglect of neighboring segments are confined to the regions of overlap. The tidal motion for the whole inlet at the end of each time increment is found by discarding erroneous portions of the solutions for the various segments and piecing together the remaining parts. A simple numerical experiment was used to test the validity of the proposed method in a known physical situation and to compare various methods of linking adjacent segments. (Woodard-USGS)

ANALOG SIMULATION OF POPULATION AGE STRUCTURES,
Maryland Univ., Solomons.
Donald R. Heinle.
University of Maryland, Natural Resources Institute, Chesapeake Biological Laboratory report, Sep 1970. 19 p, 6 fig, 2 tab, 10 ref. OWRR Project No A-002-MD (9).

Descriptors: Simulation analysis, Analog computers, Population, Age, Mortality, Copepods, Crustaceans.
Identifiers: *Acartia tonsa, *Steady-state demographic equations.

A simulation of population age structures was shown by the use of analog computers with steady state-demographic equations. The survivorship curve of a wild population of the calanoid copepod, Acartia tonsa, was observed to be very close to a negative exponential function, in spite of the fact that many of the known predators selected older copepods. The question examined of whether a small amount of selective predation would alter the age structure of the copepod population in a recognizable way. Of major importance was the fact that while a non-selective mortality did not alter the birthrate, b, or the stable age distribution, Cx, a selective mortality did. (Veverka-Cornell)

Identifiers: *Aquaculture, *Seafood industries, *Economic development, Computerized simulation, Cost estimates, Biology, Education, Hybridization, Systems engineering, Sea Grant project, *Marine resources.

Revival of Delaware's oyster industry was emphasized. A systems engineering study provided a computer simulation of a closed environment oyster plant which will be used to design the plant and analyze the effect of changes on investment and operating costs. Practical procedures were developed for breeding oysters including command spawning, supplemental feeding and environmental control; all necessary for the design of a commercial oyster hatchery with the potential for a lengthened spawning season and accelerated growth rate of larvae. This program also strengthened the faculty and curricula in Marine Science and Engineering and contributed materially to the decision to establish the College of Marine Studies.

SIMULATION OF WATER YIELD FROM DEVEGETATED BASINS,
Hydrocomp International, Palo Alto, Calif.
George Fleming.
Journal of the Irrigation and Drainage Division, ASCE, Vol 97, No IR 2, Proc Paper 8175, p 249-262, June 1971. 14 p, 5 fig, 7 tab, 9 ref, 2 append.

Descriptors: *Drainage, *Irrigation, *Vegetation, *Watersheds (Basins), Computers, Mathematical models, Management, Rivers, Simulation analysis, Water yield.
Identifiers: *Sisquoc River, *Santa Ynez River, Devegetated basins.

The application of a model called Hydrocomp Simulation Program for water shed simulation was considered with specific reference to studying the effects of vegetation management on water yields. In addition, other features of the highly interactive problem of water resources were highlighted in the form of sediment transport and water quality changes. If the balance of nature is altered, a chain reaction occurs. Examples were presented where the effects of wild forest fires on water yield were demonstrated quantitatively for the Sisquoc and Santa Ynez Rivers in California. The results of this study were then extended to determine the long term effect of planned vegetation management on both watersheds for the complete period of streamflow record. The results were presented and showed conclusively that the removal of vegetation for a watershed increases the water yield. (Veverka-Cornell)

NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY: APPENDIX D - GEOLOGY AND GROUND WATER (FINAL DRAFT),
Geological Survey, Arlington, Va. and Geological Survey, Hartford, Conn.
D. J. Cederstrom, John A. Baker, and George R. Tarver.
North Atlantic Regional Water Resources Study Coordinating Committee Report, March 1971. 240 p, 17 fig, 2 plate, 14 tab, 34 ref.

Descriptors: *Water resources development, *Northeast U. S., *Hydrogeology, *Water yield, *Groundwater, Conjunctive use, Surface-groundwater relationships, Aquifers, Aquifer characteristics, Coastal plains, Glacial drift, Water wells, Safe yield, Water quality.
Identifiers: North Atlantic Region (U. S.).

Large volumes of groundwater, from a few million to several tens of millions of gallons a day per well field, are available in the North Atlantic Region in much of the Coastal Plain; in belts of sandstone and carbonate rock (limestone and dolomite), particularly where these have been folded and faulted; and in glacial sand and gravel beds, generally adjacent to rivers and large streams. The average yield of wells in sandstone and carbonate rock is, respectively, 150 and 300 gpm. In favorable locations, wells in Coastal Plain sediments may yield in excess of 2,000 gpm and many wells in glacial deposits yield more than 700 gpm. Smaller quantities of groundwater, generally less than 75 gpm, are available from wells throughout the region in areas underlain by crystalline rocks and shale. The total volume of groundwater available in each basin is estimated and shown in tables. The quality of groundwater is generally good. (Knapp-USGS)

W71-09106

A PRELIMINARY EVALUATION OF BANK STORAGE ASSOCIATED WITH LIBBY RESERVOIR IN NORTHWESTERN MONTANA,
Geological Survey, Washington, D.C.
Donald L. Coffin.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402-Price 25 cents. Geological Survey Water-Supply Paper 1899-L, 1970. 25 p, 7 fig, 3 tab, 3 ref.

Descriptors: *Bank storage, *Reservoirs, *Aquifer characteristics, *Water table, *Montana, Model studies, Analog models, Hydrogeology, Aquifers, Reservoir yield, Groundwater, Transmissivity, Storage coefficient, Reviews, Reservoir construction.
Identifiers: *Libby Reservoir (Mont), Reservoir morphology.

Permeable sand and gravel deposits beneath the floor of the Rocky Mountain Trench in northwestern Montana and Southeastern British Columbia will become saturated and provide additional storage for Libby Reservoir, which is scheduled to begin filling in 1972. Because subsurface geologic data are insufficient to predict accurately the amount of usable bank storage, plans cannot be made to use this water for project purposes. An electric analog of the area is too crude to make final estimates of bank storage, but the model study points out that the distribution of active bank storage along the reservoir is mainly a function of the size and shape of the reservoir stage hydrograph and of the slope of the floor of the reservoir. The magnitude of active bank storage is controlled by transmissivity and storage coefficient. The model study indicates that geologic data necessary to evaluate bank storage accurately need only be collected over about one-fourth of the length of the reservoir and within about 2 miles of its edge. The study allowed the estimated cost of the data collection plan to be reduced by about half. (Woodard-USGS)

LARGE SCALE EFFECTS OF CLOUD SEEDING. 1969-70 SEASON AND TWO YEAR SUMMARY,
Aerometric Research, Inc., Goleta, Calif.
Keith J. Brown, and Robert D. Elliott.
Available from the National Technical Information Service, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Contract Report ARI-70-20, Oct 1970. 25 p.

Descriptors: *Artificial precipitation, Meteorological instruments, Sampling, Wind, California, *Cloud seeding, *Weather modification.
Identifiers: Statistical analysis, Periodic variations, Air mass analysis, Atmospheric precipitation.

This report covers the results of two years of field testing to determine the existence, magnitude and causes of large scale effects of cloud seeding. The field program was located north and east of an ongoing research seeding project by North American Weather Consultants under contract to the Naval Weapons Center. Substantial evidence is presented showing that precipitation has been more than doubled over a large area about 70 miles downwind from a point seeding source in Santa Barbara County, California. The causes of those increases have not yet been determined, but preliminary results indicate they are related to air mass temperature and wind speed and direction.

DRAINAGE MAINTENANCE AND RECONSTRUCTION COSTS AND BENEFITS: A WATERSHED ANALYSIS,
Manitoba Univ., Winnipeg. Dept. of Agricultural Economics and Farm Management.
James A. MacMillian, and Geoffrey A. Norton.
Canadian Journal of Agricultural Economics, Vol 18, No 3, p 56-63, Nov 1970. 1 figure, 7 references.

Descriptors: *Drainage programs, *Cost-benefit analysis, *Regression analysis, *Economic efficiency.
Identifiers: *Interlake Area of Manitoba, Icelandic watershed, Fund for Rural Economic Development.

This paper attempts to identify and apply economic criteria to the drainage process in the Interlake area of the province of Manitoba. The shortcomings of resource modification decisions based on single use concepts and the need for including pervasive drainage effects on the economy are outlined. A regression model, utilizing the important variables involved in drainage reclamation account for the major portion of the variation in benefits among farms. Although a cost-benefit figure of 1:6 is estimated, its interpretation is constrained by the particular economic relationship investigated, the partial nature of the analysis and the desirability of the distribution of drainage benefits. Drainage is a means of distributing income to low income farmers even though large farms receive the greatest share of benefits. (Holmes-Rutgers)

RAINFALL USE EFFICIENCY FOR DRYLAND BARLEY WITH THREE CROP AND WATER MANAGEMENT SYSTEMS,
Agricultural Research Service, Riverside, Calif.; and California Univ., Riverside.
R. E. Luebs, and A. E. Laag.
Soil Science Society of America Proceedings, Vol 35, No 2, p 336-339, Mar-Apr 1971.

Descriptors: *Water utilization efficiencies, *Watermanagement (Applied), *Dry farming, Ponding, Water storage, Moisture availability, *Barley, Growth stages, Fallowing, Farm management, Crop production.
Identifiers: *Rainfall use efficiency, *Runoff concentration, Winter rainfall distribution.

Three crop and water management systems for barley (Hordeum vulgare L.) were compared in a winter rainfall climate on Hanford sandy loam. These systems were (1) annual cropping with runoff retention, (2) a fallow-crop sequence with runoff retention, and (3) induced runoff on one-half the area for concentration and annual cropping on the remaining half. Land slope was 2-3% and runoff was retained with dikes at 7.6-m intervals in the first two systems. Over a 3-year period average grain yields were 1.58, 2.04, and 2.29 ton/ha with rainfall use efficiences of 41, 29, and 31 kg/ha-cm for annual cropping, fallow-crop, and induced runoff concentration systems, respectively. The additional soil water in downslope areas of the annual and fallow-crop systems and in areas receiving induced runoff was reflected in increased barley kernels per head and greater kernel weight. Holding runoff on the land and cropping annually increased rainfall use efficiency 42% over both that obtained where runoff occurred in the annual cropping system and that obtained for the entire plot area in the fallow-crop system. The efficiency of fallow for storing water in the soil was 16.7%. (Luebs-USDA)

ESTIMATION AND USE OF WATER PRODUCTION FUNCTIONS IN CROPS,
Hebrew Univ., Rehovoth. Faculty of Agriculture.
Dan Yaron.
Journal of Irrigation and Drainage Division, ASCE, Vol 97, No IR2, Proc Paper 8208, p 291-303, June 1971. 13 p, 2 fig, 4 tab, 19 ref, 1 append.

Descriptors: *Crop response, *Plants, *Water consumption, *Water supply, Agronomy, Irrigation, Planning, *Irrigation efficiency.
Identifiers: Crop yield, Empirical estimation.

By comparing two major theories regarding plant response to water supply and different soil moisture levels (Veihmeyer and Hendrickson; and Furr and Taylor, Hagan et al.), problems of empirical estimation of water production functions in crops were reviewed and the importance of the estimates was illustrated by several examples. The major problem of empirical estimation of such functions was their specification and in particular the choice of the independent variables, the dependent one being the crop yield per land unit. The paper concluded that while production functions with fixed intraseasonal water distribution could be estimated by regression methods, difficulties were involved in the regression approach in the estimation of dated production functions. An attempt to conceptualize the plant growth in the framework of process analysis, aimed at the derivation of growth rules was suggested. (Veverka-Cornell)

the last 5 yr, the major effort in automation of peline surface irrigation systems has been in the evelopment of: (1) a closure or diaphragm that uld automate pipe valves or outlets, (2) reliable ntrollers for remote operation, (3) improved esign of automatic valves, and (4) design of reuse stems adapted to automatic irrigation pipelines to hieve higher application efficiencies by recircuting runoff water. As a result, a reliable autoated surface irrigation system has been eveloped. The estimated cost of the system is mparable to self-propelled center pivot and less an automated solid-set sprinkler systems. The wer requirements for operating a sprinkler irgation system are considerably greater. Autoated surface irrigation systems adapt best to pes of less than 1.5%, and to soils with a medium low intake. The reuse of runoff water is an ingral part of the system. A combination of reuse d automatic surface-pipe irrigation systems has sulted in high water application efficiency and iformity coefficient. Automated surface irrigaon pipe with a reuse system can be used efficiently apply fertilizers because high coefficients of iformity are attained and the runoff water is used. (USBR)

uto-mechanization enables an irrigation farmer to ply water more efficiently with minimum labor ing automatic and semiautomatic control vices. Semiautomatic systems require manual atntion during each irrigation while automatic stems normally operate without attention. In signing channels for automatic furrow irrigation, e distribution functions are considered using ocedures developed for computing decreasing ried flow. Water is usually distributed into invidual furrows using furrow tubes, orifices, or eirs in the side of open channels. Semiautomatic ructures include: checks, dams, normally closed tes, normally open gates, and portable and mole equipment. Many structures are controlled by echanical timers. Automatic irrigation equipment using external power for operation such as electricity or fluid pressure includes pneumatic lay-flat valves and hydraulically operated gates and valves that are often controlled by programmed timers or controllers. Structures utilizing energy of the flowing irrigation stream include center-of-pressure gates, sinking float gates, and fluid diverters. (USBR)

IRRIGATION OF WINTER WHEAT IN THE ROSTOV OBLAST (RUSSIAN: REZHIM OROSHENIYA OZIMOY PSHENITSY V ROSTOVSKOY OBLASTI),
V. A. Kozin.
Gidrotekhnika i Melioratsiya, No 12, p 65-69, Dec 1970. 5 p, 2 tab, 5 ref.

Descriptors: *Irrigation systems, *Surface irrigation, *Sprinkler irrigation, *Wheat, Irrigation water, Furrow irrigation, Crop production, Meteorological data.
Identifiers: *USSR, *Rostov Oblast, Sprinklers.

Experiments were conducted in the Rostov Oblast in 1964-68 to study the effectiveness of fall surface irrigation of winter wheat and to compare it with the effectiveness of pre- and post-planting sprinker irrigation. Experiments were conducted in six variants: (1) a control experiment without irrigation; (2) furrow surface irrigation before planting; (3) furrow surface irrigation after planting; (4) sprinkler irrigation before planting; (5) sprinkler irrigation after planting; and (6) sprinkler irrigation after planting plus one sprinkler irrigation during the growing season. The increase in yield from a fall surface irrigation of the soil was 150-220% of the yield obtained in the control experiment. Sprinkler irrigation after planting of wheat produced higher increases in grain yield than irrigation prior to planting. Maximum yields of winter wheat were obtained when 1-2 sprinker irrigations during a growing season were conducted in addition to surface irrigation. To establish a large base for grain production on irrigation lands of the oblast, it is necessary to construct hydraulic structures below the Tsimlyansk reservoir for regulating Don River runoff and build an additional conduit on the Don canal; these measures will make it possible to increase grain production by as much as sevenfold over the present (1968) figure. (Josefson-USGS)

IRRIGATION METHODS FOR MEADOWS AND PASTURES (RUSSIAN: TEKHNIKA POLIVA LUGOV I PASTBISHCH),
A. M. Polonskiy, M. V. Sokolovskaya, and S. N. Nikulin.
Gidrotekhnika i Melioratsiya, No 12, p 24-32, Dec 1970. 9 p, 9 fig.

Descriptors: *Irrigation practices, *Grasslands, *Pasture management, *Sprinkler irrigation, *Equipment, Irrigation water, Fertilizers, Farms wastes, Soil properties.
Identifiers: *USSR, Sprinklers, Liquid manure.

Basic factors to be considered in selecting irrigation methods for meadows and pastures include the surface-water source, field size, configuration and relief of fields, optimal size of corrals, obstacles impeding movement and relocation of equipment, a soil's water-physical properties and the composition of the grass stand. Before irrigating, a pasture must be marked off into strips, taking into account the layout of the irrigation network, operating width of the equipment, its variable output, etc. The economic effectiveness of meadow and pasture irrigation may be increased by applying fertilizers along with irrigation water. Application of one ton of liquid value to provide a yield increase of 50-80 feed units (equal in nutritional value to 50-80 kg of oats), which, when calculated for one hectare, will equal a yield increase of 1,000-2,000 feed units. Sprinklers and pumps under development in the USSR will provide for simultaneous application of liquid manure and irrigation water to crop rotation fields. Series production of two American-made sprinklers is contemplated following extensive testing in the Volga River region, Ukraine and Moscow Oblast. (Josefson-USGS)
W71-09132

IRRIGATION AND UTILIZATION OF IRRIGATED LANDS IN THE ASTRAKHAN' OBLAST (RUSSIAN: OROSHENIYE I ISPOL'ZOVANIYE OROSHAYEMYKH ZEMEL' V ASTRAKHANSKOY OBLASTI),
V. S. Bondarev, and V. Ye Viktorov.
Gidrotekhnika i Melioratsiya, No 12, p 18-23, Dec 1970. 6 p, 4 tab.

Descriptors: *Irrigation practices, *Irrigated land, *Crop production, Irrigated water, Sprinkler irrigation, Fertilizers, Farms wastes, Soils, Vegetable crops, Rice, Melons.
Identifiers: *USSR, *Astrakhan' Oblast, Sovkhozes, Kolkhozes, Sprinklers, Irrigation agriculture.

The natural economic conditions of the Astrakhan' Oblast are favorable for the cultivation of crops and have contributed for years to the development of irrigation agriculture. Although the crop lands under irrigation occupy only 25% of the entire sowing area, they provide 85-88% of total crop production. Recently, more than 42,000 ha of new irrigation land have been cropped, including 21,900 ha for rice crop rotations. A total of 935,000 ha of pasture land has been supplied with irrigation water. Of the total area of irrigation land (105,000 ha), 65,000 ha have an irrigation network. Sprinkler irrigation is becoming increasingly common on kolkhoz and sovkhoz lands of the oblast. The extent of agricultural lands under sprinkler irrigation has increased from 3,300 ha in 1963 to 49,700 ha in 1969. Practices employed at kolkhozes and sovkhozes have demonstrated the high economic effectiveness of fertilizer application. When 10-12 cntr of mineral fertilizers/ha were applied, the yield of unpolished rice increased by 15-20 cntr/ha,/ that of vegetables by 200-250 cntr/ha, and that of watermelons by 150-200 cntr/ha. 4A. Control of Water on the Surface

FIELD TESTS OF ICE PREVENTION TECHNIQUES,
Corps of Engineers, Anchorage, Alaska. Alaska District.
Julius H. Moor, and Carl R. Watson.
Proceedings of the American Society of Civil Engineers, Jouranl of the Hydraulics Division, Vol 97, No HY6, Paper 8179, p 777-789, June 1971. 13 p, 15 fig, 5 ref.

Descriptors: *Ice jams, *Flood control, *Ice breakup, *Rivers, *Alaska, Albedo, Hydraulics, River basin development, Melting, Ice, Freezing.
Identifiers: *River ice control.

The U.S. Army Corps of Engineers, Air Force, and the State of Alaska conducted a field research program in Alaskan rivers to find an economical and reliable technique for reducing ice jams and consequent flood frequencies. Procedures based upon principles described by previous researchere were: (a) Aerial dusting using fly ash which created a shear line along which the ice broke up more readily. (b) Pumping of river bottom materials onto the ice surface which decreased the albedo. (c) Cutting holes in the ice by blasting to utilize pressure flow of subsurface water produced by increased run-off of spring thaw to overflow parts of the ice cover with warmer river water. The costs in manpower, equipment, and materials are shown for each procedure. The results show that dusting through absorption of incident isolation will result in increased melt rates of snow and ice. Similar results were obtained with pumped river bottom materials. Pressure flow results will require further research, although the creation of holes in the ice of blasting or other mechanical means appears to be a positive method for creating a shear line which also offers open water to solar exposure and increased melting; however, blasting methods may kill or demand some aquatic organisms. Paper 70-709, 1970 Winter Meet, American Society of Agricultural Engineers, Chicago, Ill, Dec 1970. 17 p, 4 fig, 4 tab, 10 ref.

Descriptors: Experimental data, *Experimental farms, Irrigation water, *Drainage engineering, Drainage systems, *Drain tiles, Gravels, Chemical analysis, Polymer concretes, Tile drainage, *Salt balance, Excess water (Soils), *Perched water table, Sand drains, Clay pipes, Concrete pipes, Plastic pipes, Performance, California.
Identifiers: San Joaquin Valley (Calif).

An 80-acre experimental plot was installed in the San Joaquin Valley of California to test the effects of varying design of several trench and gravel envelope placements on the effectiveness of tile drainage. Information collected from the experimental plot, and theoretical considerations of soil moisture tensions and trench geometry have led to the conclusion that the effectiveness of the gravel envelop depends largely upon the position of the gravel with respect to the tile drain and, to a minor extent, upon the effective trench perimeter. The quantity and position of the gravel placement may also influence peak discharge rates. Data will be gathered for approximately 5 additional years to evaluate more fully the various treatments with respect to water and salt movement and durability of pipe materials. (USBR)

DESIGN CRITERIA FOR IRRIGATION SYSTEMS WITH COMPLEX PIPE LOOPS,
Nebraska Univ, Lincoln.
D. M. Edwards, and B. Spencer.
Paper 70-723, 1970 Winter Meet, American Society of Agricultural Engineers, Chicago, Ill, Dec, 1970. 8 p, 4 fig, 1 tab, 7 ref.

Descriptors: *Pipelines, Design, Irrigation efficiency, Velocity, Head losses, *Irrigation systems, Computer applications, Water requirements, *Sprinkler irrigation, Water distribution (Applied), Water application rate, Water pressure, Topography.
Identifiers: *Hardy Cross method, Irrigation requirement.

New design analysis becomes necessary as irrigation systems become more complex. The analysis of a simple hydraulic system presents little difficulty, but when more complex systems are developed, the simpler procedure may fail to yield a solution. Uniform water application from irrigation systems on irregular topography such as golf courses, recreational areas, or specialized cropping areas deny simplicity in design. Such is also the case with multi-well fields and newly developed permanent solid set sprinkler, subsurface, trickle irrigation systems, and complex loop networks used in municipal water distribution systems. Upon adapting loop networks to irrigation systems, improved irrigation system design resulted. Loop networks can be solved using the Hardy Cross iterative technique. A procedure for designing irrigation systems involving pipe loop networks is presented. An iterative Hardy Cross analysis was used in the basic design procedure. The method can be programed on a digital computer. (USBR)

SEEPAGE EFFECT ON CHANNEL BANK STABILITY,
Bureau of Reclamation, Denver, Colo. Hydraulics Machinery Branch; and Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Philip H. Burgi, and Susumu Karaki.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 97, No IR-1, Paper 7968, p 59-72, Mar 1971. 14 p, 9 fig, 3 tab, 6 ref, append.

Descriptors: *Alluvial channels, *Seepage, *Bank stability, *Pore pressure, Erosion, Tractive forces, Scour, Erosion control, Hydraulic gradient, Groundwater movement, Open channel flow.
Identifiers: *Channel bank stability.

Canal side slope stability is related to groundwater hydraulic gradient, channel flow velocity and initial side slope angle. A quantitative, as well as qualitative, investigation of channel side slope stability is based on an experimental investigation of a trapezoidal channel in a laboratory flume. Various combinations of the variables were tested to determine the effect of seepage on channel side slope stability with various hydraulic and geometric conditions in the channel. An empirical relationship was developed for side slope seepage, expressing the erosion of the side slope as a function of hydraulic gradient and flow velocity in the channel. At relatively low velocities (less than 1 ft per sec) the erosion of the side slope is due primarily to the hydraulic gradient. At higher channel velocities, the side slope erosion is a function of channel flow velocity as well as the groundwater hydraulic gradient. (Knapp-USGS)

Identifiers: *USSR, *Belorussia, Poles'ye.

As of January 1, 1970 about 1.6 million ha of land had been reclaimed in the Belorussian SSR with soil improvement methods applied to 800,000 ha. Analysis of the hydroclimatic characteristics of Belorussia for the period 1959-1965 showed that, except for 1962, there was a 15-20% decrease in normal streamflow for the area and as much as a 45-50% decrease in 1964 on rivers of the Poles'ye. In dry years runoff may not occur at all for 3-4 months on rivers with basin areas of 30-75 sq km. According to the Scientific Research Institute on Water Problems, USSR Ministry of Water Management, fluctuations in streamflow in the nonchernozem zone are basically the result of changes in climatic conditions. Reclamation of bogs and waterlogged soils of the area has a generally favorable effect on groundwater flow, especially on minimum and low flow, which are most important in the utilization of water resources of rivers. Plans are underway to expand construction of reservoirs, ponds, fish hatcheries, drainage and irrigation systems throughout the vast area of Belorussia. (Josefson-USGS)

ESTIMATING MEAN-ANNUAL RUNOFF USING CHANNEL EOMETRY MEASUREMENTS,
Geological Survey, Carson City, Nev.
Donald O. Moore.
Proceedings of 24th Annual Nevada Water Conference, Nevada Division of Water Resources and Nevada State Reclamation Association, Sept 24-25, 1970, Carson City, p 40-42, 1970. 3 p.

Descriptors: *Channel morphology, *Alluvial channels, *Stage-discharge relations, *Runoff forecasting, Stream gages, Gaging stations, Streamflow, Analytical techniques.
Identifiers: *Runoff estimation.

In Nevada, the Geological Survey is currently collecting records at 121 full-time gaging stations, 125 crest-stage gages, 10 low-flow partial-record stations, 13 lake and reservoir stations, and about 250 groundwater observation wells. It is often necessary to estimate the mean runoff in ungaged streams by transfer of data where streamflow records are available. But in many areas, particularly in the southwest, the transfer of data is difficult or impossible, and the mean runoff, therefore, has to be determined by other methods. A method of estimating the mean-annual runoff of ungaged streams uses stream-channel measurements. The method is based upon the assumption that channel dimensions adjust themselves to streamflow. Therefore, inspection and measurement of a stream channel should provide evidence of its mean-annual runoff. In developing the method, it was noted that the cross sections in perennial streams were deeper and more narrow than those in ephemeral streams. The ratio of width to depth in perennial streams, in the areas studied, averages about 20 to 1, whereas in the ephemeral streams, the width-depth ratio averaged about 50 to 1. Because of these differences, two sets of curves were developed to estimate the mean-annual runoff: one set for ephemeral streams, and the other for perennial streams. (Knapp-USGS)

PRELIMINARY REPORT ON WIND-TIDE FLOODING IN NEW HANOVER COUNTY, NORTH CAROLINA.
Corps of Engineers, Wilmington, N.C.

Army Corps of Engineers Flood Report, Dec 1969. 4 p, 11 plate.

Descriptors: *Floods, *Flood damage, *North Carolina, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: New Hanover County (NC), Standard project flood, Intermediate regional flood.

Wind-tide flooding of New Hanover County, North Carolina is described in a report of flood plain problems based on records of rainfall, runoff, and

historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combination of these approaches. Wind tides affect the ocean front, the lagoon areas behind the barrier beach system, and the Cape Fear and Northeast (Cape Fear) Rivers. Fifty-four hurricanes have affected the New Hanover County coastline during the 20th century, and wind-tide stages have exceeded 5 feet mean sea level five times since 1954. (Woodard-USGS)
W71-09335

FLOOD PLAIN INFORMATION, WILLAMETTE RIVER, JOHNSON, KELLOGG, AND MT. SCOTT CREEKS, MILWAUKIE-OAK GROVE-LAKE OSWEGO, OREGON.
Corps of Engineers, Portland, Oreg.

Army Corps of Engineers Flood Plain Report, May 1970. 55 p, 6 fig, 24 plate, 17 tab.

Descriptors: *Floods, *Flood damage, *Oregon, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: *Willamette River (Oregon), Standard Project Flood, Intermediate Regional Flood.

Flooding of the Willamette River and tributaries, Milwaukie, Oak Grove, and Lake Oswego, Oregon, is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. The flood of December 1964 was produced by one of the most intense rainfall and snowmelt combinations that has occurred in the Pacific Northwest. Rainfall ranged from 6 to 10 inches over the entire Willamette Basin during the 4-day period, December 19-23. Had there been no upstream storage regulation, a catastrophe would have been experienced. Peak discharges in excess of 100 cubic feet per second per square mile were recorded at many gaging stations in western Oregon. (Woodard-USGS)
W71-09336

FLOOD HAZARD REPORT OF 4-7 JULY 1969 FLOOD, HURON RIVER, NORWALK CREEK, OHIO.
Corps of Engineers, Buffalo, N. Y.

Army Corps of Engineers Flood Plain Report, May 1970. 23 p, 28 fig, 12 plate, 3 tab.

Descriptors: *Floods, *Flood damage, *Ohio, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: Huron River (Ohio), Flood records.

Flooding of the Huron River, Ohio, is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. The water stage recorder on the Huron River about 500 feet downstream of U. S. Highway 250, 0.25 mile northwest of Milan, Erie County, and two miles downstream of the confluence of the east and west branches was installed in 1950. The stage at the gage site in July 1969 (31.1 feet) was 7 feet higher than the stage for the January 1959 highwater occurrence (24.1 feet). The discharge in 1959 was 25,800 cfs and it has a recurrence interval in the order of once in 40 years. The 1969 flood has an estimated discharge of 48,900 cfs and it has a recurrence interval in the order of once in 125 years. (Woodard-USGS)
W71-09337

FLOOD PLAIN INFORMATION, QUACHITA RIVER, BAYOU LAFOURCHE AND TRIBUTARIES, MONROE, LOUISIANA.
Corps of Engineers, Vicksburg, Miss.

Corps of Engineers Flood Plain Report, June 1970. 57 p, 27 fig, 19 plate, 15 tab.

Descriptors: *Floods, *Flood plains, *Flood damage, *Louisiana, Historic flood, Regional flood, Flood forecasting, Design flood.
Identifiers: *Monroe (Louisiana), Ouachita Parish (La.), Standard Project Flood, Intermediate Regional Flood.

Flooding along the Ouachita River, Bayou LaFourche, Chauvin Bayou, and Youngs Bayou in Monroe, Louisiana, and vicinity is described in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The highest flood of record on the Ouachita River at Monroe in May 1958 with a stage of 50.45 feet (elevation 81.85). The greatest recorded flood on the Bayou LaFourche was in April 1947 with a stage of 28.7 feet (elevation 65.8) at Crew Lake, Louisiana. The Intermediate Regional Flood would be about 4 feet higher than the maximum flood at Monroe. (Woodard-USGS)
W71-09338

SPECIAL FLOOD HAZARD INFORMATION REPORT ON ECONLOCKHATCHEE RIVER, ORANGE AND SEMINOLE COUNTIES, FLORIDA.
Corps of Engineers, Jacksonville, Fla.

Corps of Engineers Flood Plain Report, June 1970. 3 p, 21 fig, 1 map.

Descriptors: *Floods, *Flood damage, *Florida, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: Orange County (Fla), Seminole County (Fla), Standard Project Flood, Intermediate Regional Flood.

Flooding of the Econlackhatchee River, Orange and Seminole Counties, Florida, is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occured and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. The U.S. Geological Survey has maintained a stream gage on Econlockhatchee River at the State Highway 13 bridge near Chulota since 1935. The highest stage recorded at this gage was 20.8 feet during the March 1960 flood. The maximum discharge of record, 11,000 cfs, occurred during that same flood, which has an estimated frequency of once in 30 years. (Woodard-USGS)
W71-09339

FLOOD PLAIN INFORMATION, VERMILION RIVER, SKELLENGER CREEK, AND BONNEY CREEK, OHIO.
Corps of Engineers, Buffalo, N. Y.

Army Corps of Engineers Flood Plain Report, Ma
1970. 18 p, 16 fig, 14 plate, 3 tab.

Descriptors: *Floods, *Flood damage, *Ohio
Flood plains, Flood control, Non-structural alter
natives, Maximum probable flood, Historic flood.
Identifiers: Vermilion River (Ohio), Standard pro
ject flood, Intermediate regional flood.

Flooding of the Vermilion River, Ohio is describe
in a report of flood plain problems based o
records of rainfall, runoff, and historical an
present flood heights. Maps, photographs, profiles
and cross sections indicate the extent of floodin
that has occurred and which may be expected t
occur in the future. The information is for use i
study and planning ways to minimize vulnerabilit
to flood damages by control of flood plain use b
zoning and subdivision regulations, the construc
tion of flood protection works, or by combination
of these approaches. During the 1969 flood th
river reached its highest level, dating back to th
early 1900's. The Vermilion Lagoons area, locate
on the right bank and extending from the mout
upstream to Liberty Avenue, suffered the greates
damage. The storm began at about 7:00 p.m. o
Friday (July 4) and at 1:00 a.m. on Sunday the gag
at North Ridge Road recorded a peak of 17.1 fee
the maximum stage of record, and about 15 fee
above normal for that time. (Woodard-USGS)

**A FLOOD INSURANCE MODEL FOR SHARIN
THE COSTS OF FLOOD PROTECTION,**
Central Connecticut State Coll., New Britai
Dept. of Economics.
James C. Loughlin.
Water Resources Research, Vol. 7, No. 2, 3 table
1 figure, 12 references, p. 236-244 April 1971.

Descriptors: *Flood plain insurance, *Costs, *No
structural alternatives.
Identifiers: *1968 Flood Control Act, Flood I
surance Act.

The author states that there is an over reliance o
structural measures and insufficient consideratio
of nonstructural measures (zoning, land us
warnings, flood insurance, etc.). A flood insuran
program alerts the potential occupant of the risk
faces. Both types of measures, at a least cost co
bination, should be used. With the passage of th
National Flood Insurance Program in 1968, the
was an increase in the financial liability of the
sidents. It is a new way of finding optimal use of th
flood plain. (Campbell-Rutgers)

nethod of forecasting total flow of water to large
es of the Ladoga basin from December of one
ar through October of the next is based on a rela-
nship between anomalies of flow and anomalies
atmospheric circulation and on development of
nospheric circulation processes during the for-
tion of flow and the preceding period (May-Oc-
er of the first year). The reliability of the rela-
nship, which makes it possible to predict a given
w one year in advance, is 0.88. The results of
ng a prognostic relationship of total annual flow
antecedent atmospheric circulation are satisfac-
y for developing long-range forecasts of
nimum navigational levels for Lake Ladoga.

n, Balneology.

e formation and distribution of groundwater in
vast desert regions of the Manygyshlak Penin-
a and Ust Urt Plateau are examined with par-
lar reference to depths of groundwater occur-
ce, groundwater yields and groundwater
drodynamic, hydrochemical and hydrothermal
ditions. Large natural resources of fresh and
ckish groundwater can be found in the aquifers
the region, particularly in Permian-Triassic,
wer Cretaceous, Miocene deposits and in sandy
massifs. Fresh waters can be effectively used for domestic consumption and for serving industrial projects in Southern Mangyshlak; brackish waters can be used for flooding pasture lands and for meeting domestic and industrial needs and, in some instances, for oasis irrigation. Extensive use can be made of mineral and thermal waters of the region, for example, for balneotherapy and for supply of heat. (Josefson-USGS)

OBSERVATIONS ON WATER CONTENT CHANGES IN STRATIFIED SEDIMENTS DURING PIT RECHARGE,
Arizona Water Resources Research Center, Tucson.
L. G. Wilson.
Ground Water, Vol 9, No 3, p 29-40, May-June 1971. 11 p, 7 fig, 23 ref.

Descriptors: *Pit recharge, *Artifical recharge, *Unsaturated flow, *Water reuse, *Water level fluctuations, Hydrogeology, Hydrographs, Infiltration, Percolation, Water table, Water levels, Alluvium, Porous media, Soil water movement, Groundwater recharge.
Identifiers: Recharge testing.

Two pit recharge tests were conducted at an instrumented research site near Tucson, Arizona using cooling tower blowdown effluent from a nearby power plant. The first trial in 1966 consisted of 142 days of continuous inundation. The second test in 1968, comprised 15 wet-dry cycles with a total inundation time of 80 days. Qualities recharged by the two management techniques were contrasted. Water content profiles in 14 access wells clearly delineated two principal recharge mounds built above the water table within stratified materials in the 80 ft deep zone of aeration. During the continuous inundation test three stages were apparent in the history of the recharge mounds: growth stage, equilibrium stage and drainage stage. It was possible to relate these various stages to intake characteristics of the pit. (Knapp-USGS)

4C. Effects on Water of Man's Non-Water Activities

FOREST CUTTINGS RAISE TEMPERATURES OF SMALL STREAMS IN THE SOUTHERN APPALACHIANS,
Southeastern Forest Experiment Station, Franklin, N.C. Coweeta Hydrologic Lab.
Lloyd W. Swift, Jr., and James B. Messer.
Journal of Soil and Water Conservation, Vol 26, No 3, p 111-116, May-June 1971. 6 p, 2 fig, 2 tab, 22 ref.

Descriptors: Clear-cutting, *Water temperature, *Runoff, Small watersheds, Water conservation, Water quality, Vegatation effects, Thermal pollution, Fish, Trout, Water pollution sources.
Identifiers: Stream water temperatures.

Stream temperatures were measured during six forest-cutting treatments on small (23- to 70-acre) watersheds in the sourthern Appalachian Mountains. Where forest trees and all understory vegetation were completely cut maximum stream temperatures in summer increased from the normal 66 deg F to 73 deg or more. Some extreme treatments raised temperatures more than 12 deg above normal. Where steambank vegetation was uncut or had regrown, summer maximums remained unchanged or declined from temperatures measured under uncut mature hardwood forest. Increases in stream temperature were judged to degrade water quality and constitute thermal pollution because, after each clearcut, water temperatures exceeded optimum levels for trout habitat. TALL WHEATGRASS BARRIERS FOR SOIL EROSION CONTROL AND WATER CONSERVATION,
Agricultural Research Service, Sidney, Mont. Soil and Water Conservation Research Div.
A. L. Black, and F. H. Siddoway.
Journal of Soil and Water Conservation, Vol 26, No 3, p 107-111, May-June 1971. 5 p, 4 fig, 3 tab, 7 ref.

Descriptors: *Erosion control, *Water conservation, *Windbreaks, *Wheatgrss, *Snow management, Water storage, Wind erosion, Shelterbelts, Soil conservation, Cover crops, Sediment control.
Identifiers: *Wind erosion control.

A perennial grass barrier system of conservation farming was evaluated for soil-water conservation and soil erosion control. Each barrier consisted of two rows of tall wheatgrass (Agropyron elongatum) seeded in 36-inch rows. Barriers were spaced 30 to 60 feet apart. By trapping snow, the continuous crop sequence with barriers stored 86 to 116% as much water as crop-fallow without barriers. At a height of 12 inches, windspeed from leeward of one barrier to windward of the next barrier increased from 17 to 70% of open field windspeed in the 30-foot barrier spacing and from 19 to 84% in the 60-foot interval. (Knapp-USGS)
W71-09276

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

TOXICITY OF SEA WATER TO COLIFORM BACTERIA,
Metcalf and Eddy, Boston, Mass.
Hugh P. Savage, and Bruce N. Hanes.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 854-861. 16 fig, 1 tab, 16 ref.

Descriptors: *Coliform, *Bioindicators, Saline water, *Toxicity, Light intensity, Temperature, Bacteriophages, Sedimentation, Adsorption, Biochemical oxygen demand, Nutrients, Bacteria, Sampling, Analytical techniques, Water quality control, *Pollutant identification, Water pollution effects.
Identifiers: *Bacterial density, Predators.

Investigations were conducted to establish whether or not the presence of coliform organisms in sea water provides a direct indication of recent fecal contamination. Samples taken in the ocean several miles offshore have been consistently devoid of coliforms, seemingly indicating that sea water has a toxic effect on coliforms. Samples of sea water were taken from an area relatively devoid of direct fecal contamination and mixed with raw sewage to yield desired BOD to volume ratios. BOD levels in flasks in conditions A, B, and C. were 0.6 to 1.8 mg/l, 9.9 to 20 mg/l, and 101 to 120 mg/l respectively. The conclusions obtained from this series of tests included: (1) somewhere between 1 and 10 mg/l BOD, fresh seawater temporarily loses its toxicity to total and fecal coliform bacteria; (2) in fresh seawater with BOD levels of 10 to 120 mg/l, a linear relationship seems to exist between the log of the maximum bacterial densities and the initial BOD; (3) the percentage of both fecal and total coliform bacteria contributing to the total population increased as maximum density was approached and declined as the populations declined; and (4) by themselves, total and fecal coliform bacteria are not reliable indicators of the degree of recent fecal pollution in seawater since, given sufficient nutrient levels, the bacterial density will increase. (Lowry-Texas)
W71-08946

ANALYSIS OF WATER FOR MOLECULAR HYDROGEN CYANIDE,
North American Rockwell Corp., Athens, Ga. Rocketdyne Div.
K. H. Nelson, and I. Lysyj.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 799-805. 4 fig, 2 tab, 8 ref. FWPCA Contact No 14-12-491.

Descriptors: *Toxicity, *Chemical wastes, Waste water (Pollution), Aquatic environments, Analytical techniques, Instrumentation, Water analysis, Gas chromatography, Polarographic analysis, Calibrations, Electric currents, Cathodes, Anodes, Temperature, Hydrogen ion concentration, Water quality, Pollutant identification.
Identifiers: *Hydrogen cyanide.

An analytical technique to measure concentrations of molecular hydrogen cyanide at levels of less than 100 parts per billion has been developed. The method used combines vapor phase equilibrium techniques with highly sensitive amperometric techniques to measure sparged HCN with a rotating gold anode by measuring current output of the system. Calibration of the system was accomplished using synthetic solutions of known composition. Synthetic unknowns were then tested, as well as fresh water from Sespe Creek in Ventura County, California. Synthetic samples of pH 6.1, 7-2, and 8.2 had standard deviations of 1.42, 2.59, and 3.12 respectively. The fresh creek water, to which known amounts of cyanides were added, had a pH of 8.2 and a standard deviation of 1.35. Current responses of a number of possible interferring ions were also measured. It was determined that H2S, in levels greater than the concentration level of HCN, could interfere with the readings. In concentrations below that of HCN, H2S was shown to have no effect on the readings. Present detection limits seemed to have been established by the techniques of handling and transferring nanogram quantities of the desired species. Therefore, improved handling techniques along should provide the prodecure with considerably more resolution. (Lowry-Texas)
W71-08952

A SIMPLE METHOD FOR THE BIOLOGICAL ASSESSMENT OF THE EFFECTS OF WASTE DISCHARGES ON AQUATIC BOTTOM-DWELLING ORGANISMS,
Virginia Polytechnic Inst., Blacksburg, Va.
John Cairns, Jr., and Kenneth L. Dickson.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 755-772. 7 fig, 3 tab, 41 ref.

Descriptors: *Statistical methods, *Mathematical models, Ecosystems, Sampling, Biological properties, Isolation, Analytical techniques, Microorganisms, Biological communities, Data processing, *Pollutant identification, Water pollution effects.
Identifiers: *Sequential Comparison Index, Redundancy expression, Confidence levels.

Biological methods of assessing pollutional damage are increasing in prominence with respect to physical and chemical methods. To facilitate the acceptance of biological monitoring, a complete program, including sampling, collection, isolation, preservation, identification, and data analysis, is presented. Sampling equipment includes multiple-plate artificial substrate samplers, bottom basket type artificial substrate samplers, grab samplers, surber square foot samplers, dredges, and nets. Data evaluation includes a comparison of species counted by both a biologist and a non-biologist, indicating that most bottom fauna organisms are fairly easily dividable into recognizable entities by non biologists. The Sequential Comparison Index (SCI) is introduced as a simplified method for estimating relative differences in biological diversity. The SCI is a rapid technique based on difference in shape, color, and size of the organisms collected. Confidence levels are established using a diversity index value obtained from collecting point data. This technique involves too much mathematical manipulation to be widely applied, but a computer program is also presented which will compute the diversity per individual, d, and the redundance expression, r. LOW AMBIENT LEVEL UPTAKE OF 14C-DDT BY THREE SPECIES OF MARINE PHYTOPLANKTON,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
James L. Cox.
Bulletin of Environmental Contamination and Toxicology, Vol. 5, No. 3, p 218-221, 1970. 1 tab, 1 ref. NSF Grant No. 8408 and California Marine Research Commission, unspecified grant.

Descriptors: *DDT, *Pesticide residues, *Absorption, *Phytoplankton, *Analytical techniques, Chlorinated hydrocarbon pesticides, Pesticide kinetics, Bioassay, Laboratory tests, Pollutant identification, Water pollution sources.
Identifiers: Accumulation, Concentration, Syracosphaera sp., Thalassiosira sp., Amphidinium sp.

Because it was deemed desirable to determine partition coefficients of organisms for DDT residues at concentrations similar to those in the marine environment, an attempt was made to measure carbon-14-DDT uptake for three species of marine phytoplankton in pure culture. At equilibrium, 16 54% of the initially added C-14-DDT was removed from the water by the algal cells. True partition coefficients calculated using known volume percentages for the algal clones used in these experiments are 2.5 x 104 for Syracosphaera carterae and for Thalassiosira fluviatilus, and 8.0 x 104 for Amphidinium carteri. These values are equivalent to wet weight concentration factors. (LeGore Washington)

AERIAL PHOTOGRAPHY OF OIL SLICKS,
Field Studies Council, Pembroke (England). Oil Pollution Research Unit.
Roger Worsley.
Field Studies Council, Oil Pollution Research Unit Orielton Field Centre, Annual Report, 1969, p 49-50.

Descriptors: *Oil, *Oily water, *Remote sensing, *Aerial photography, *Warning systems, Oil wastes, Water pollution sources, Pollutant identification, Pollution abatement.
Identifiers: *Oil pollution, *Oil spills, *Detection of pollution, Infra-red photography.

Infra-red color photography was investigated as a potential tool for early detection of marine oil spills. Details of techniques used are provided. The author concludes that the techniques are not suitable for routine use, which would entail specially loaded cameras on all existing air services, applicability in only bright sunlight, and use of critical important exposures and processing. Similarly

larization photography, though easier, is unsuita- e because the need for the aircraft to circle would quire substantial deviations from planned flight ths. Either method, however, would be useful in ergency situations. (LeGore-Washington)

MULTIPLE CORER FOR SAMPLING OFUNDAL BENTHOS,
eries Research Board of Canada, Winnipeg anitoba). Freshwater Inst.
drew L. Hamilton, William Burton, and John F. nnagan.
rnal Fisheries Research Board of Canada, Vol No 10, p 1867-1869, 1970. 2 fig, 3 ref.

criptors: *Sampling, *Profundal zone, nthos, Cores, Invertebrates, Stratigraphy, Sedi- ts.
ntifiers: *Multiple corer, Chironomid.

nterpreting the results of earlier studies of the roinvertebrates that live in lake sediments, the iencies of the samplers used have not been luated. Since recent efforts in aquatic biology e been directed toward such basic problems as duction and community energetics, the need for ntitative, or at least semiquantitative samplers, developed. A multiple corer for sampling the benthos of profundal sediments is described. It is relatively simple to construct and is light (approximately 17.5 lb (7.9 kg)) and easy to use. Since the area to be sampled is very small, several samples are needed. This corer is designed to take four core samples simultaneously, thus compensating for the small size of the individual core tubes. The samples from each core can, depending on circumstances, be analyzed separately or lumped together in a single sample. The sampler is well suited for use in small boats lacking power equipment. Trials reported elsewhere indicate that in soft sediments the samples taken are generally superior to those collected with most, if not all, of the more conventional samplers tested. (Jones-Wisconsin)

APPLICATION OF ASSOCIATION-ANALYSIS TO DISTRIBUTION STUDIES OF RECENT FORAMINIFERA,
Bedford Inst. Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
G. Vilks, E. H. Anthony, and W. T. Williams.
Canadian Journal of Earth Sciences, Vol 7, No 6, p 1462-1469, 1970. 4 fig, 3 tab, 6 ref.

Descriptors: *Analytical techniques, *Bioassay, *Marine microorganisms, Distribution, Environmental gradient, Animal groupings, Benthos, Ecological distribution, Ecosystems, Statistical methods.
Identifiers: *Foraminifera, *Association analysis, Canadian Arctic, Multivariate method, Marine ecology.

Important factors underlying an ecosystem may be revealed objectively through suitable analysis of interspecific associations of its biota. This objective assessment is valuable in surveys of remote areas such as marine benthos where visual examination is difficult if not impossible. Foraminifera are used for this analysis because of their ubiquitous distribution, large population, and large numbers of species readily identified. Counts of species from 75 samples of sediment from East Bay, Mackenzie King Island, in the Canadian Arctic were converted to a matrix of presence-absence data (56 species X 75 stations). These were submitted to both normal and inverse association-analysis as a preliminary test of the application of that multivariate method to problems in marine ecology. Results are compared with observations made at the time the survey was carried out. Although the pattern of sampling was not the most suitable for association-analysis, the results indicate that this analysis holds some promise of informative revelations about the Foraminifera environment. In experimental approaches to understand problems of marine ecology, the inverse form of association analysis may indicate groups of organisms particularly useful for comparative physiological ecology. A COMPUTER BASED FLORISTIC ANALYSIS OF PAMLICO RIVER PHYTOPLANKTON,
East Carolina Univ., Greenville, N.C. Dept. of Biology.
Vincent J. Bellis.
Available from North Carolina Water Resources Research Institute, Raleigh, North Carolina 27607 - Price: $2.50. Available from National Technical Information Service as PB-200 262, $0.95 in microfiche. Report No 46, UNC-WRRI, North Carolina State University at Raleigh, Jan 1971. 28 p, 7 fig, 5 tab, 13 ref. OWRR Project A-044-NC (1).

Descriptors: *Phytoplankton, *Plant groupings, Computer programs, Numerical analysis, *Aquatic life, *Data processing, North Carolina.
Identifiers: *Pamlico River.

A computer based technique for analyzing distribution patterns among estuarine organisms was developed and tested on phytoplankton collections from Pamlico River. Jaccard's coefficient of similarity was used to generate a similarity matrix with final printout in dendrogram form showing clusters of collections having inherent similarity. Use of a similarity index based solely upon presence or absence of species within all possible pairs of collections (raw data) produced a dendrogram which described the seasonal periodicity of phytoplankton in the central Pamlico River. Computer programs developed in this project are written in Fortran IV and have been deposited in the program library of the East Carolina University Computer Center and can be obtained upon request from its director. (Howells-North Carolina)

MIGRATION AND METABOLISM IN A STREAM ECOSYSTEM,
North Carolina Univ., Chapel Hill. Dept. of Zoology; and North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
Charles A. S. Hall.
Available from UNC-WRRI, North Carolina State University, Raleigh, North Carolina, 27607 - Price: $2.50. Available from the National Technical Information Service as PB-200 264, $0.95 in microfiche. Report No 49, WRRI, The University of North Carolina, Feb 1971. 243 p, 52 fig, 33 tab, 120 ref, append. OWRR Project B-007-NC (3).

Descriptors: *Ecosystems, Aquatic environment, Aquatic habitat, Limnology, *Fish migration, *Standards, *Sampling, Water analysis, Migration, *Metabolism, North Carolina, Monitoring, Dissolved oxygen, Water quality, Productivity.
Identifiers: *Stream surveys, *Stream classification, New Hope Creek (N.C.).

Fish migration and total stream metabolism were monitored in New Hope Creek, N.C., from April, 1968 to June, 1970. Most of the 27 species had a consistent pattern of larger fish moving upstream and smaller fish moving downstream. In the spring of 1969, a daily average of 7 fish weighing a total of 1081 grams were caught moving upstream, and 17 fish, weighing a total of 472 grams, were caught moving downstream. The larger average size of the fish moving upstream resulted in a large transfer of fish mass upstream. Diurnal oxygen series were run to measure the metabolism of the aquatic community. Gross photosynthesis ranged from 0.21 to almost 9 g m-2 day-1 (g/m2/day), and community respiration from 0.4 to 13 g m-2 day-1 at the principal sampling station and both were highest in the spring. Area values of metabolism were similar for different parts of the stream, but both production per volume and respiration per volume were much larger near the headwaters than farther downstream. Migration may allow populations to take advantage of such differences in productivity by maintaining young fish in areas of high productivity. An energy diagram was drawn comparing energies of insolation, currents, photosynthesis, respiration, fish populations, and migrations. Parts of this model were simulated on an analog computer. Input energies from insolation and stream flow were similar. About 0.14 percent of the total respiration of the stream was from fish populations, and over one year about 0.01 percent of the total energy was used for the process of migration. The migration energy has an amplifying value of 14. Recommendations are included concerning sampling for dissolved oxygen and other aspects of water quality management.

RADIATION SURVEILLANCE - MONITORING THE ENVIRONS OF A NUCLEAR STATION,
Iowa-Illinois Gas and Electric Co.
L. C. Oyen.
Mechanical Engineering, Vol 92, No 8, p 32-37, Aug 1970.

Descriptors: *Radioisotopes, *Absorption, *Nuclear wastes, *Radioactive wastes, Food chains, Surface waters, Groundwater, Groundwater movement, Air pollution effects, Water pol-

lution effects, Strontium radioisotopes, Iodine radioisotopes, Fish, Milk, Mississippi River, Sediments, Water pollution sources.
Identifiers: Cesium radioisotopes.

The Quad-cities Nuclear Plant has a monitoring program that may serve as a prototype. Air, water, vegetation, soil, and key foods such as fish and milk will be surveyed periodically both off- and on-site in accordance with 'Federal Standards for Protection against Radiation.' Water and sediment at the plant intake and discharge canals to the Mississippi River is sampled continuously. Drinking water from on-site wells and from the four closest off-site wells, and Mississippi River water at the intake of downstream communities is sampled periodically. (Bopp-ORNL)

THE STUDY OF THE PHYSICAL, CHEMICAL AND BIOLOGICAL NATURE OF WATER QUALITY UNDER UTAH CONDITIONS,
Utah State Univ., Logan.
John M. Neuhold.
Available from the National Technical Information Service as PB-200 621, $3.00 in paper copy, $0.95 in microfiche. Utah State University Project Completion Report, June 1971. 57 p, 19 fig, 10 tab, 13 ref, append. OWRR Project A-003-Utah (14).

Descriptors: *Tertiary treatment, *Water pollution control, *Bibliographies, *Abstracts, *Municipal wastes, Water quality, Utah, Aquatic habitats, Bioindicators, Environment, Ecology, Fish, Dissolved oxygen, Sewage treatment.
Identifiers: *Logan River (Utah).

Domestic sewage effluent into a high mountain valley stream can produce a complexity of effects on receiving waters. Mountain streams are cold waters which have envolved a diverse biological system adapted to cold temperature, clear water and in which sewage effluents can persist for relatively long periods of time. The lower Logan River below the City of Logan is such a stream. It receives domestic effluent from the City of Logan, which at the start of the study went directly, untreated, into the Logan River, and during the course of the study was diverted through an extensive primary-secondary-tertiary treatment lagoon system returning treated water back to the receiving stream. The physical, chemical and biological qualities of the Logan River were studied before and after treatment. The development of a biological system and its effect on the physical and chemical qualities in the lagoon system, built essentially upon a primordial substrate, were also studied. An annotated bibliography of 250 references on waste water stabilization ponds is included. Tertiary treatment ponds can be ecologically managed to minimize organic build-up. Design criteria should also be established to maximize retention time to fully utilize the ecosystem developed in the pond. Free-form designs are suggested as a possible means to accomplish this with the added benefit of improving acsthetics of the system. (Knapp-USGS)

WATER ANALYSIS,
Geological Survey, Denver, Colo.
M. J. Fishman, and D. E. Erdmann.
Analytical Chemistry, Vol 43, No 5, p 356-388, April 1971. 33 p, 631 ref.

Descriptors: *Reviews, *Bibliographies, *Water analysis, *Chemical analysis, Solutes, Ions, Pesticides, Dissolved oxygen, Detergents, Organic matter, Radioisotopes, Stable isotopes, Trace elements.
Identifiers: Dissolved gases.

This review of the literature of analytical chemistry applied to water analysis covers a period from October 1968 through September 1970. The review includes a list of other reviews made in the period covered. Water analysis is subdivided into classes of constituents analyzed, and includes pesticides, oxygen, gases, detergents, organics, radioisotopes, stable isotopes, heavy metals, and mercury, as well as common and trace ionic solutes. A bibliography of 631 entries is divided into the same classes as the text. (Knapp-USGS)
W71-09289

MERCURY IN A COASTAL MARINE ENVIRONMENT,
Southampton Univ. (England).
J. D. Burton, and T. M. Leatherland.
Supported by Natural Environment Research Council. Nature, Vol 231, No 5303, p 440-442, June 18, 1971. 3p, 1 tab, 14 ref.

Descriptors: *Heavy metals, *Pollutant identification, *Poisons, *Estuaries, *Sea water, Path of pollutants, Water pollution sources, Bottom sediments, Water chemistry, Water analysis, Water quality.
Identifiers: *Mercury, *English Channel, Southampton water.

Mercury enters the oceans at comparable rates as a result of both human activities and continental weathering. The oceanic residence time of mercury is about 10,000 yr, so that human activities cannot yet have had a significant influence on the amounts of the element in the marine environment considered on a wide scale, whatever the effects on restricted environments. Some initial findings of investigations carried out in Southampton Water and the English Channel are discussed with these considerations in mind. Mercury in natural waters was determined spectrophotometrically with dithizone, after preliminary concentration and separation. Mercury in organisms and sediments was determined by neutron activation analysis of freeze-dried material. River Water entering Southampton in the Rivers Test and Itchen contained 0.010 micrograms/liter less than that in the estuary and the open water of the English Channel. The concentrations in whole Mercenaria, without shell, ranged from 0.18 to 0.57 p.p.m. dry weight (0.03 to 0.12 p.p.m. wet weight). Three samples from the surface of the bottom mud in different parts of the estuary had mercury contents ranging from 0.19 to 0.64 p.p.m. Two samples of mud from underlying anoxic layers, at depths of about 10 cm, contained 2.2 and 5.7 p.p.m. showing that pronounced enhancement can occur in reducing conditions. (Knapp-USGS)

Geokhimiya No 3, p 339-354, Mar 1971. 16 p, fig, 7 tab, 14 ref.

Descriptors: *Inorganic compounds, *Radioactive dating, *Radiochemical analysis, *Radioisotopes, Uranium radioisotopes, Histograms, Pumice, Mud, Diagenesis, Sea water, Geochemistry.
Identifiers: *USSR, *Pacific Ocean, Nodules, Thorium radioisotopes, Protactinium, Plutonium, Ionium, Sea muds, Isotopic composition.

The content of U-234, U-238, Th-232, Io (Th-230), RdTh (Th-228), Pa-231 and Pu-239 in more than 100 samples of iron-manganese nodules of the Pacific is examined. The nodules reveal very large fluctuations in Th:U ratios, which usually correlate with the ratios of Io: U-238 and Pa: U-235. No genetic relationship can be seen between the nodules, underlying muds and pumice. The uranium content in the volcanogenic nuclei of nodules is 10 times that in basalts of the Pacific Isles. The extremely high Th:U ratio in several of the samples and very low Io: U and Pa:U ratios in other nodules seem convincing proof of the volcanogenic origin of their radioisotopes. (Josefson-USGS)

A MODULAR CONTROLLED-TEMPERATURE APPARATUS FOR FISH EGG INCUBATION AND FRY REARING,
Federal Water Quality Administration, Duluth, Minn. National Water Quality Lab.
J. Howard McCormick, and Roll F. Syrett.
National Water Quality Laboratory, mimeographed report, Nov 1970. 18 p, 8 fig, 2 ref.

Descriptors: *Bioassay, *Toxicity, *Laboratory equipment, *Laboratory tests, Analytic techniques, Bioindicators, Pollutant identification, Water pollution effects, Facilities, Research facilities, Testing, Water quality, Juvenile fishes, Fry.
Identifiers: *Continuous-flow bioassay, Chronic pollution.

An apparatus is described for aquatic bioassay studies. The apparatus described is constructed on a modular basis and provides continuous flow of water at constant temperatures for experiments work with fish eggs and fry. Each module provides one test temperature, which is controlled with a thermoregulator and immersion heater in each headbox. Flow is regulated by headbox elevation and orifice size. 5B. Sources of Pollution

IDENTIFICATION OF IRRIGATION RETURN WATER IN THE SUB-SURFACE, PHASE III: KAHUKU, OAHU AND KAHULUI AND LAHAINA, MAUI,
Hawaii Univ., Honolulu. Water Resources Research Center.
Pedro A. Tenorio, Reginald H. F. Young, Nathan C. Burbank, Jr., and L. Stephen Lau.
Available from the National Technical Information Service as PB-200 166, $3.00 in paper copy, $0.95 in microfiche. Technical Report 44, Dec 1970. 53 p, 36 fig, 11 ref, append. OWRR Project B-013-HI (1).

Descriptors: *Irrigation water, Groundwater, Nitrates, Dissolved solids, Hawaii, *Return flow, Water pollution sources, *Water reuse, Aquifers, Water quality, Pumping, Fertilization, Consumptive use.
Identifiers: *Irrigation return water.

The basal water quality of the Hawaiian Commercial and Sugar Company (HC and S) aquifer is most affected regionally, as well as locally, by the prevailing agricultural practices. The deterioration of the water is due in part to fertilization and to a greater extent to heavy pumping and recycling of the basal water. Water quality in the Pioneer Mill area parallels that of HC and S, although on a regional basis, the basal water quality, unlike that of the Pioneer Mill area, is not as deteriorated. Local effects of pumping are also especially noticeable in the Pioneer Mill area. Groundwater quality in the Kahuku area shows the obvious presence of irrigation return water indices, but, unlike the two plantations on Maui, the magnitude of the increases relative to uncontaminated water sources is considerably smaller. The effect of fertilization on Kahuku may be considered to be a principal factor in the regional distribution of index constituents with a relatively uniform nitrate distribution throughout. Local effects of pumping are quite pronounced and influence overall increases of indices, indicating that where heavy pumping takes place for irrigation, the increase in index constituents are correspondingly greater.

THE USE OF WATER AS A SAMPLING MEDIUM FOR TRITIUM OXIDE,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
D. McConnon.
Available from the National Technical Information Service as BNWL-CC547, $3.00 in paper copy, $0.95 in microfiche. Report BNWL-CC547, 1970. 13 p.

Descriptors: *Tritium, *Oxides, *Air, *Pollutants, *Sampling, Surfaces, Water pollution, Analytical techniques, Measurement, Indicators.

A sampling technique for airborne tritium oxide was developed and tested for 98 percent efficiency. The technique employs a gas wash bottle filled with ordinary distilled water through which air is bubbled at a constant flow rate. The method is rapid, reliable, and sensitive and has been proven under a variety of field conditions. Additionally, a technique is described for determining the amount of tritium oxide surface contamination. Because of difficulties in measuring the collection efficiency of the technique, it is presently used for qualitative measurements as a trend indicator. (Houser-NSIC)

Available from the National Technical Information Service as BMI-171-30, $3.00 in paper copy, $0.95 in microfiche. Report BMI-171-30, Apr 3, 1970. 40 p, 1 fig, 14 ref. Contract AT (26-1)-171.

Descriptors: *Radioisotopes, *Absorption, *Food webs, *Nuclear explosions, Ecosystems, Human population, Water pollution, Radioactivity effects, Mathematical models, Drainage systems, Water pollution sources, Atlantic Ocean, Pacific Ocean, Canals, Runoff, Fallout.

In this study, a series of models has been used to identify the most important radionuclides and other factors affecting the calculation of potential radiation doses to man. The major kinds of food-web pathways are considered in an area large enough to include terrestrial, freshwater, and marine ecosystems; and to indicate the degree of ecological coupling between man and the environment, including food and water. To be conservative, a model is located within the watershed that has the highest fallout input and the lowest rate of radionuclide loss due to runoff; but the calculations for the aquatic compartments are based on the highest rate of runoff. For the marine ecosystem, the fallout input to seawater is maximized; the input from surface water is maximized; and the dilution due to dispersion and convection is minimized. Some differential equations for describing the biological transport are derived, and representative methods for obtaining the transfer coefficients are given. Analytical, finite-difference, and semianalytical methods for solving the differential equations are briefly described and a few methods are presented explicity with examples. RADIOECOLOGICAL STUDIES ON THE COLUMBIA RIVER. PART I,
Battelle Northwest, Richland, Wash. Pacific Northwest Lab.
D. G. Watson, C. E. Cushing, C. C. Coutant, and W. L. Templeton.
Available from the National Technical Information Service as BNWL-1377, $3.00 in paper copy, $0.95 in microfiche. Report BNWL-1377, June 9, 1970. 46 p.

Descriptors: *Radioisotopes, *Absorption, *Biota, Zinc radioisotopes, Phosphorus radioisotopes, Runoff, Waste dilution, Water pollution control, Plankton, Periphyton, Seasonal, Radioecology, Water pollution sources.

The concentration of radionuclides which is found in natural waters and in biota is reduced by dilution from seasonal runoff. The increase in uptake by biota from the increase in metabolic activity in the spring is soon overwhelmed by runoff. Present data is similar to that collected prior to 1956 for beta, but not for gamma radiation levels. Shutdown of all reactors for several weeks dropped the level of most nuclides in the biota several orders of magnitude. The highest concentration factors were found in net plankton and periphyton for phosphorus-32 and zinc-65. (Bopp-NSIC)

PILGRIM NUCLEAR POWER STATION. PRELIMINARY SAFETY ANALYSIS REPORT, AMENDMENT 16.
Boston Edison Co., Mass.

Available from the National Technical Information Service as DOCKET-50293-31, $3.00 in paper copy, $0.95 in microfice. Report DOCKET-50293-31, Oct 2, 1970. 189 p.

Descriptors: *Water pollution control, *Nuclear power plants, *Potable water, *Biota, Sampling, Marine fish, Marine animals, Marine algae, Tritium, Iodine radioisotopes, Strontium radioisotopes, Zinc radioisotopes, Cobalt radioisotopes, Absorption, Water pollution sources.
Identifiers: Manganese radioisotopes, Cesium radioisotopes.

The surveillance program outside the station security fence includes the air, domestic and sea water, marine life, silt, milk, and crops. Water pumping stations which control water supply to most area residents are sampled and analyzed for gross beta and gamma biweekly, and for tritium and strontium monthly. Sea water intake and discharge canals are analyzed monthly for gross beta and gross gamma (with gamma spectrum analysis if the gross gamma increases), and tritium. Quarterly composites of the monthly samples are analyzed for manganese-54, zinc-65, cobalt-58, and cobalt-60. Fish, lobsters, and mollusks are sampled quarterly; Irish sea moss, during its harvest period. All marine life samples are taken from the vicinity of the discharge canal outfall and offshore current patterns and are analyzed for gross beta, gross gamma, strontium-90, cesium-137, manganese-54, cobalt-58, cobalt-60, zinc-65, and iodine-131. Equipment failures are analyzed with respect to release of radionuclides to the environment. (Bopp-NSIC)

FINAL REPORT OF OFF-SITE SURVEILLANCE FOR THE MILROW EVENT, OCTOBER 2, 1969.
Southwestern Radiological Health Lab. Las Vegas, Nev.

Available from the National Technical Information Service as SWRHL-95r, $3.00 in paper copy, $0.95 in microfiche. Report SWRHL-95r, June 1970, 22 p, 1 fig, 4 tab.

Descriptors: *Explosions, *Excavation, *Pollutants, *Water pollution control, *Water pollution sources, Envrionment, Environmental effects, Environmental engineering, Soil structure, Porosity, Porous media, Population, Geology, Alaska.

Amchitka Island, a member of the Aleutian Islands, was first used for an underground nuclear test in October 29, 1965. A second underground test, called the Milrow Event, was conducted by the Atomic Energy Commission at Amchitka on October 2, 1969. This report presents the operational procedures and results of the Public Health Service, Southwestern Radiological Health Laboratory off-site radiological safety and community information programs provided for Milrow. The off-site radiological safety program included operating environmental surveillance networks of air samplers, thermoluminescent dosimeters and gamma-rate recorders before and after the detonation, and fielding 13 radiation monitors for the detonation. All surveillance and monitoring results indicated no increase in radioactivity above background levels in the off-site area following the event. (Houser-NSIC)

TRITIUM IN NEW YORK STATE WATERS, 1965,
New York State Dept. of Health, Albany. Kurt Anderson Bureau of Radiological Health.
Kurt Anderson.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $0.50. Radiological Health Data and Reports, Vol. 10, No. 3, p. 93-97, 3 fig, 3 tab, 2 ref, March 1969.

Descriptors: *Tritium, *New York, *Rivers, *Lakes, *Sampling, Explosions, Fallout, Precipitation (Atmospheric), Surface runoff, Surface waters, Waste dilution, Water pollution sources.

The states major rivers, creeks, and lakes were sampled to see what variations in tritium content occurred throughout the state. Since most tritium in the atmosphere from nuclear weapons probably reaches the surface waters in precipitation, one would expect that running water, such as in creeks and rivers (made up of recent precipitation runoff) may be higher in tritium than large, deep lakes that contain older water, thus providing greater dilution (Houser-NSIC)

DISPOSAL OF RADIOACTIVE WASTE FROM U.S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1969,
Naval Ship Systems Command, Washington, D.C. Nuclear Power Directorate.
J. J. Mangeno, and M. E. Miles.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $0.50. Radiological Health Data and Reports, Vol. 11, No. 8, p. 373-377, 3 tab, 9 ref, August 1970.

Descriptors: *Ships, *Radioactive waste disposal, *Water pollution sources, *Water pollution effects, Water pollution control, Monitoring, Oceans, Harbors, Naval architecture, Nuclear energy, Measurement, Discharge, Regulation, Sediments, Radioisotopes, Cobalt, Data collection.

This report summarizes data on disposal of radioactive wastes from U.S. Naval Nuclear-Powered Ships and their support facilities and summarizes results of environmental monitoring performed to confirm adequacy of waste disposal limits and procedures. The waste disposal data presented show that the total long-lived radioactivity in liquid waste discharges associated with operation and maintenance of naval nuclear-powered ships totaled 0.05 curies in 1969 for all harbors. This is comparable to the average of 0.2 curies discharged per year during the preceding 3 years for all harbors and is less than the average of 4 curies reported discharged per year during the preceding 5 years. Results of environmental surveys of harbor water and bottom sediment for gross radioactivity and for cobalt-60 (Houser-NSIC)

THE PERCH LAKE EVAPORATION STUDY - THE USE OF RADIOISOTOPES IN HYDROLOGY, FEBRUARY 1970, VIENNA, AUSTRIA.
Atomic Energy of Canada Ltd., Chalk River (Ontario).

Report AECL-3557, February 1970, CONF-700328-2, Paper SM-129/10 at IAEA Symposium on Uses of Isotopes in Hydrology, Vienna, March 9-13, 1970.

Descriptors: *Hydrologic Cycle, *Tracers, *Basins, *Lakes, *Tritium, Water vapor, Evaporation, Groundwater, Base flow, Model studies, Water pollution sources.

The primary purpose of the Perch Lake Project is to exploit the use of radioactive tracers in the study of all aspects of the hydrological cycle in a small, well-defined basin. Within this broad objective, a number of individual studies are being conducted, of which one, the use of tritiated water vapour for the study of evaporation mechanisms in a natural setting, is believed to be unique. Other studies include the determination of the water, tritiated water, energy, and trace-element budgets of the lake, of which the first three complement the use of tritiated water vapour to study basic evaporation mechanisms. Radioactive tracers have been used particularly for estimating the ground-water components of the water and tritium budgets. Groundwater flows predicted by the use of conventional hydrological techniques as well as various new models are being compared with the results obtained by using radioactive tracers. (Houser-NSIC)

TRITIUM INJECTION AND CONCENTRATION DISTRIBUTION IN THE ATMOSPHERE,
International Atomic Energy Agency, Vienna (Austria).
W. R. Schell, G. Sauzay, and B. R. Payne.
Journal of Geophysical Research, Vol. 75, No. 12, p. 2251-2266, April 20, 1970.

Descriptors: *Tritium, *Tracers, *Atmosphere, *Model studies, *Injection evaporation, Water vapor, Condensation, Meteorology, Parametric hydrology, Fallout, Precipitation (Atmospheric), Deuterium, Oxygen.

The use of environmental tritium as a water tracer has significantly increased our understanding of hydrological processes. Because of the large stratospheric reservoir of tritium produced by nuclear detonations and the relatively slow mixing rates between the stratosphere and the troposphere, studies of meteorological parameters of transport and diffusion can be made over many years. If the nuclear test ban treaty is observed and if no more large atmospheric nuclear detonations are conducted, the seasonal and annual changes in the atmospheric tritium distribution can give important information on the hydrological cycle and on meteorological effects. This paper relates stratospheric injection for a water tracer to the concentration of tracer in precipitation by means of meteorological parameters. A simplified model has been developed that relates injection, exchange evaporation, condensation of water vapor, and tritium to meteorological parameters in the troposphere. Since the form of the model is general, tritium, fallout radionuclide, deuterium, and oxygen 18 data can be used as tracers to test the basic assumptions and to examine the physical processes that are occurring. The model was tested with meteorological data and tritium concentrations in precitation from the IAEA/WMO World Network of sampling stations. The results of the initial application of the model to western Europe are presented. (Houser-NSIC)

TRITIUM GEOPHYSICS AS AN INTERNATIONAL RESEARCH PROJECT,
California Univ. San Diego, La Jolla.
H. E. Suess.
Science, Vol. 163, March 28, 1969, p. 1405-10.

Descriptors: *Geophysics, *Tritium, *Water vapor, *Tracers, *Precipitation (Atmospheric), *Oceans, *Runoff, *Surface water, Surveys, Ground water, Surface drainage, Economics, Meteorology, Water pollution sources.

Tritium is produced by cosmic ray on the order of 30 atoms per square centimeter of the earth's surface per minute. During 1961 and 1962 quantities of tritium greatly in excess of those naturally present were released artificially into the atmosphere by testing of hydrogen bombs. This amount can be estimated from the observed tritium content of precipitation and of the surface water of the oceans to be of the order of 105 grams. At this time all the water present on the surface of the earth, in the form of water vapor in the at

osphere, of cloud droplets, precipitation, and surce water is tagged with a measurable amount of itium. This situation affords us with a unique opportunity to study the behavior of water of our enronment in connection with many problems of eat scientific or economic importance. A proam has been initiated by the IAEA to make use of is opportunity. (Houser-NSIC)

EDIMENT, OUR GREATEST POLLUTANT,
gricultural Research Service, Oxford, Miss. Sedintation Lab.
R. Robinson.
per 70-701, 1970 Winter Meet, American ciety of Agricultural Engineers, Chicago, Ill, Dec 70. 15 p, 16 ref.

escriptors: *Sediments, Sediment production, ediment transport, Bibliographies, Deposition, llutants, *Water pollution, Erosion, Soil erosion, rbidity, Chemical properties, *Pesticide sidues, Solutions, Water resources, Fish conservtion, Eutrophication, Flood plains.
entifiers: Soil deposits.

diment becomes a pollutant when it occupies ter storage reservoirs, fills lakes and ponds, clogs eam channels, settles on productive lands, stroys aquatic habitat, and creates turbidity that tracts from recreational use of water. As a result, liment degrades water for consumptive or other es, increases water treatment costs, and damages ter distribution systems. Sediment is the carrier other pollutants such as plant nutrients, insectides, herbicides, and heavy metals. There is also dence that bacteria and virus are carried by sedients. Primarily, the larger sediment particles are st readily controlled by available technology; er particles are the principal carriers, more ac- chemically, and transported farther before position. Sediment is our greatest pollutant of ters in terms of volume, but in some instances, y actually remove and deposit pollutants from ution. In this case, sediment acts as a scavenger. SBR)

SPERSION IN HETEROGENEOUS NONUFORM ANISOTROPIC POROUS MEDIA,
rdue Univ., Lafayette, Ind. School of Chemical gineering.
bert A. Greenkorn.
py available from GPO Sup Doc, $1.00; crofiche from NTIS as PB-200 258, $0.95. Enonmental Protection Agency, Water Pollution ntrol Research Series Report, September 1970. p, 28 fig, 8 tab, 28 ref, 3 append. EPA Grant 060 DLL (Formerly WP-101048-03).

escriptors: *Dispersion, *Porous media, *Soil ter movement, *Groundwater movement, *Path pollutants, Mixing, Anisotropy, Non-uniform w, Hydraulic models, Mathematical models, acers, Statistical models.
ntifiers: *Nonuniform anisotropic porous dia.

understanding of the dispersion phenomenon is cessary to predict flow of miscible fluids in nonmogeneous porous media. A literature review of dispersion in nonhomogeneous porous media was made and the continuum and statistical theories of flow in porous media were used with experiments in models of unconsolidated porous media to study the effects of heterogeneity, nonuniformity, and anisotropy on dispersion. Dispersion changes significantly with permeability. When models of different permeability are connected, the dispersive effect is not reciprocal. Dispersion changes significantly with nonuniformity. Likewise there is a significant effect when models of different nonuniformity are interconnected (second-order heterogeneity). Anisotropy was included in two kinds of models (linear and radial) by packing alternate layers of beads causing flow through these layers at different angles. The results have practical application, especially in tracing contaminants in surface and subsurface flow such as movement of pesticides, fertilizers, acid mine drainage, and feedlot waste through the soil. PERSISTENT PESTICIDES IN THE ENVIRONMENT,
Rothamsted Experimental Station, Harpenden (England).
Clive A. Edwards.
Originally published as CRC Critical Review in Environmental Control, Vol 1, No 1, Feb 1970. (See W70-05057). Cleveland, Ohio, CRC Press (Division of Chemical Rubber Co), 1970. 78 p, 3 fig, 24 tab, 322 ref, append.

Descriptors: *Pesticide residues, *Hazards, *Pollutants, *Reviews, *Bibliographies, Fishkill, Pesticide kinetics, Distribution patterns, Path of pollutants, Pesticide toxicity, Pesticide removal, Public health, Water pollution sources, Pesticide drift, Water quality, Environment, Ecology.
Identifiers: Persistent pesticides.

Some of the more important pesticide residue surveys and experimental studies of residues in both the physical and biological sections of the environment are summarized in order to assess the present state of knowledge of the status of pesticide residues in the environment. Recent data are presented on the amounts of residues in all compartments of the environment to show how they are concentrated from the physical to the biological parts of the environment and into the upper trophic levels of food chains. The most difficult thing to assess from data currently available is not what the present situation is, but what changes will occur if certain actions, for example a ban on a particular pesticide, are taken. The cycling of pesticides in the environment is summarized to illustrate the movements of residues through the various compartments of the environment. A bibliography of 322 entries is included. ENVIRONMENTAL MERCURY RESEARCH IN SWEDEN,
Swedish Environment Protection Board, Stockholm.
J. E. Larsson.
Swedish Environment Protection Board Report, June 1970. 44 p, 3 fig, 4 tab, 56 ref.

Descriptors: *Heavy metals, *Poisons, *Metal organic pesticides, *Water pollution effects, Pathology, Reviews, Path of pollutants, Public health, Bibliographies, Chemical wastes, Water pollution sources, Regulation, Human pathology, Food chains, Fallout, Fishkill, Toxicity, Water quality, Biochemistry, Bottom sediments.
Identifiers: *Mercury, *Methyl mercury, *Heavy metal poisons (Mercury).

The circumstances under which the mercury problem in Sweden was discovered are discussed, with a review of the research which was initiated as its consequence. Research outside Sweden is reported only when it has a direct influence on Swedish mercury research. The decisions of administrative authorities in the mercury field are reported with the effects of these decisions and measures. Comprehensive evidence documents the connection between the introduction of alkylmercury-containing seed disinfectants and increased content of mercury in the feathers and livers of birds, in particular birds of prey. In the water environment, extended investigations show increased mercury content of bottom sediment and fish in areas which are influenced by industrial pollution. Contaminated fish led to 'black listing' of several inland waters and some bays along the Swedish coast. Animal experiments show that methylmercury is metabolized slower than all other investigated mercury compounds. Experiments on animals show that methylmercury causes damage to the central nervous system and has an effect on hereditary mechanisms. Research in progress is mainly concentrated on the water environment. Mercury fallout is studied by sampling of air and precipitation and by analyses on lichens and mosses. Studies include the effects of methylmercury on behavior and learning, hereditary mechanisms, the detoxifying capacity of the liver, the metabolism of steroid hormones, and on the breeding results of fish. MERCURY--MAJOR NEW ENVIRONMENTAL PROBLEM,
New York State Dept. of Environmental Conservation, Albany. Bureau of Fish.
Carl E. Parker.
The Conservationist, August-September, p 6-9, 1970. 3 fig.

Descriptors: *Heavy metals, *Water pollution sources, *Public health, Human pathology, Fish, Standards, Great Lakes, Air pollution effects, Pesticides, Agriculture, Aquatic animals, Food chains, Sampling, New York.
Identifiers: *Mercury, Sweden, Toxic levels.

The present critical status of water pollution with mercury is reviewed. By the food-chain concentration, mercury of industrial wastes and pesticides attains extremely dangerous levels of toxicity in fish flesh. As shown by recent studies, mercury affects adversely the entire man's organism culminating in permanent brain damage; in several instances mercury-contaminated fish caused multiple deaths. The arbitrary tolerance levels in food vary at this time from 0.05 ppm, suggested by the World Health Organization/Food and Agriculture Organization, to 1.00 ppm, acceptable by Sweden. However, even the latter, highly questionably concentration will not permit either commercial or sport fishing in many water basins of the world. Analyses of water fowl and upland birds are likely to effect a drastic reduction of hunting. The solution of the mercury problem is hindered by the stubborn resistance of both industry and agriculture--a resistance pregnant with dire consequences. Thus far the burden of responsibility was on the Department of Fish and Wildlife, but in the future, mercury will be one of the major preoccupations of the new Department of Environment Conservation. RADIOACTIVE POLLUTION OF RIVERS IN CZECHOSLOVAKIA,
Ustav Hygieny, Prague (Czechoslovakia).
Borivoj Havlik.
Health Physics, Vol. 19, p 617-624, Nov. 1970. 5 fig, 4 tab, 17 ref.

Descriptors: Water pollution effects, *Mining, *Uranium radioisotopes, *Radium radioisotopes, Potassium radioisotopes, Background radiation, Rivers, Streams, Absorption, Biota, Plankton, Aquatic plants, Sediments, Fallout, Water pollution control, Recirculated water, Water pollution sources, Mine drainage, Domestic water.

One of the oldest uranium mining areas in the world is the spa Jachymov in Bohemia. A study of environmental contamination began there when uranium mining was at a maximum, and continued until mining ceased 6 years later. Content of radium-226 and total beta activity of water, river sediments and water plants were estimated in the streams of this area and from the other uranium ore area, where mining reached its maximum during the study period. Radioactive pollution of the major Czechoslovak rivers during 1964-67 is described. (Bopp-NSIC)

STUDY OF THE PHYSICAL CHEMISTRY OF RUTHENIUM IN SEA WATER, (IN FRENCH),
Commissariat a l'Energie Atomique, La Hague (France).
Pierre Guegueniat.
Available from the National Technical Information Service as LEA-R-4125, $3.00 in paper copy, $0.95 in microfiche. Report CEA-R-4125, Dec. 1970. 22 p.

Descriptors: *Sea water, *Physicochemical properties, *Radioisotopes, Colloids, Solubility, Sediments, Water pollution effects, Nuclear wastes, Sedimentation, Absorption, Adsorption, Water pollution sources.
Identifiers: *Ruthenium radioisotopes.

The insoluble forms of ruthenium are sedimented, but soluble forms are carried away to the open sea. The importance of sediments in the contamination of marine organisms was shown in earlier experiments. The present chemical study shows that areas needing further work for clarification of ruthenium contamination are: (1) colloidal ruthenium compounds, (2) absorption on precipates formed when nuclear wastes are discharged into the ocean, (3) absorption by ocean sediments. RADIOLOGICAL SURVEILLANCE STUDIES AT A BOILING-WATER NUCLEAR POWER REACTOR,
Environmental Health Service, Cincinnati, Ohio.
B. Kahn, R. L. Blanchard, and H. L. Krieger.
Availability: UNIPUB, Inc, PO Box 433, New York, NY. International Atomic Energy Agency, Symposium 146-26, p 537-548, New York, Aug 10-14, 1970. 19 p, 10 tab.

Descriptors: *Radioisotopes, *Effluents, *Environment, *Surface waters, *Radiation, *Nuclear power plants, Pollutants, Water pollution control, Water pollution sources, Water pollution treatment, Analytical techniques.

Radionuclides in water, gases, and airborne particles were measured at the Dresden Nuclear Power Station and in its environment in order to provide the technical basis for surveillance programmes at nuclear power stations. Concentrations of radionuclides in the primary coolant and the off-gas were determined on several occasions. At the same time, radioxenon concentrations and external radiation exposures were measured near the plume within 1-2 km of the stack, and the radionuclide content of effluent water was measured near the point of discharge. Samples of food, feed, and water from the immediate environment were also analyzed for specific radionuclides. Results of radionuclide analyses and radiation exposure calculations are presented. ENVIRONMENTAL ASPECTS OF KARACHI NUCLEAR POWER PLANT,
Pakistan Atomic Energy Commission, Karachi.
M. Nasim.
Availability: UNIPUB, Inc, PO Box 433, New York, NY. International Atomic Energy Agency Symposium 146-51, p 781-789, New York, Aug 10-14, 1970. 10 p.

Descriptors: *Nuclear power plants, *Effluents, *Pollutants, *Path of pollutants, *Surface waters, Water pollution control, Water pollution sources, Radiation, Radioisotopes, Population, Food chains, Diets, Oceans.

To ensure that environmental dose limits for routine exposures are not exceeded, a program for the environmental survey of the site has been started. Environmental surveillance data would also be used as a basis for estimating population exposure. The program is basically directed at the identification of possible routes (exposure pathways) of contamination to the population. These include air and water pathways and fish and agricultural crops. (Houser-NSIC)

DOSE ESTIMATION STUDIES RELATED TO PROPOSED CONSTRUCTION OF AN ATLANTIC-PACIFIC INTEROCEANIC CANAL WITH NUCLEAR EXPLOSIVES: PHASE III,
Oak Ridge National Lab., Tenn. Health Physics Div.
Stephen V. Kaye, and Paul S. Rohwer.
Availability: NTIS. ORNL-4579, Dec 1970. 145 p, 18 tab, 6 fig, 7 append.

Descriptors: *Canals, *Canal construction, *Canal Zone, *Atlantic Ocean, *Pacific Ocean, *Nuclear explosions, Pollutants, Water pollution, Soil contamination, Pollution abatement, Population, Radioecology, Radioactivity effects, Diets, Environmental effects, Environmental gradient.

This document is the final report covering contributions of the Health Physics Division of Oak Ridge National Laboratory (ORNL) to the Bioenvironmental Radiological Safety-Feasibility Study of a sea-level canal excavated with nuclear explosives. Potential doses to indigenous populations along Route 17 in eastern Panama and Route 25 in northwestern Colombia were estimated for a combination of hypothetical exposures to radiation. The studies attempted to determine when it might be appropriate for the evacuated populations to reenter areas adjacent to the two routes. The only modes of exposure considered were external exposure to a contaminated land surface and internal exposure from the ingestion of four types of contaminated foods and beverages. Parameters in the internal dose models were adjusted to differentiate five age groups within each of four indigenous populations and nine reference organs. These populations were further differentiated on the basis of diet and estimates of time- and age-dependent concentrations of radioactivity in dietary items. (Houser-NSIC)

THE BRITISH APPROACH TO ENVIRONMENTAL MONITORING,
United Kingdom Atomic Energy Authority, London (England). Authority Health and Safety Branch.
H. J. Dunster, A. W. Kenny, W. T. L. Neal, and A Preston.
Nuclear Safety, Vol 10, No 6, p 504-513 (Dec 1969).

Descriptors: *Environment, *Monitoring, *Regulation, *Radioactivity effects, Waste water pollution, Waste water disposal, Water pollution control, Water pollution sources, Nuclear reactors, Nuclear wastes, Effluents, Oceans.

Environmental monitoring forms an integral part of arrangements in Britain for controlling radiation exposure of the public. When detectable exposure to radiation occurs, the 'critical pathway' is used to establish the dose received by the 'critical' population group. When no increase in exposure can be detected, the simplest possible indication system is used to ensure that no significant change in the situation occurs. (Houser-NSIC)
W71-09240

RADIOECOLOGY OF CESIUM-137 AND STRONTIUM-90 IN A FOREST,
Institute of Public Health, Tokyo (Japan); Kiryu Coll. of Technology (Japan); and Japan Analytical Chemistry Research Inst., Tokyo.
Noboru Yamagata, Shunji Matsuda, and Morito Chiba.
Journal of Radiation Research (Tokyo), Vol 10, p 107-112 (Sept-Dec 1969). 2 fig, 7 tab, 3 ref.

Descriptors: *Strontium radioisotopes, *Coniferous forests, Absorption, Ecosystems, Food chains, Soil-water-plant relationships, Shrubs, Root zone, Fallout, Runoff, Water pollution sources.
Identifiers: *Cesium radioisotopes.

The highest concentration of both radionuclides was found in the fallen leaves and this can be

reasonably explained by the fact that the fallout rates were the highest three years ago. About 80% and 63% of the total deposition, respectively, of cesium-137 and strontium-90 were found in the upper 5 cm layer of soil; 18% and 23% in the vegetation, of which 11.4% and 10.7% were in fallen leaves. Uptake of strontium-90 by the pine tree and shrub roots was at least twice that of cesium-137. (Bopp-NSIC)
W71-09241

POLLUTION OF A MARINA AREA BY WATERCRAFT USE AS INDICATED BY COLIFORM AND CHEMICAL CONCENTRATIONS,
Michigan State Univ., East Lansing. Dept. of Microbiology; and Michigan State Univ., East Lansing. Inst. of Water Research.
W. N. Mack, and F. M. D'Itri.
Available from the National Technical Information Service as PB-200 622, $3.00 in paper copy, $0.95 in microfiche. Michigan State University Project Completion Report, May 1971. 15 p, 2 fig, 6 tab, 10 ref. OWRR Project A-038-MICH (1).

Descriptors: *Water pollution sources, *Bioindicators, *Coliforms, *Michigan, Marinas, Boats, Docks, Harbors, Inland waterways, Lake Michigan, Recreation, Boating, Water sports.
Identifiers: Watercraft pollution.

Samples of water from a marina area in Michigan used by watercraft were tested for the number of coliform organisms. There was a slight increase in the coliform most probable number of organisms in the slips most frequently used by the yachts. Outside sources of contamination probably added to the total number of organisms present in the area. Although an increase in the number of organisms was related to the presence of yachts in the marina, the concentration was far below the standard of total body contact as established by the Water Quality Standards for Michigan Intrastate Waters. Chemical analysis of water samples taken at the marina were all within the normal limits for the specific area. Other factors contributing to the presence of the coliform organisms in this relatively unpopulated area were considered. (Knapp-USGS)

PERSISTENCE OF PESTICIDES IN RIVER WATER,
Environmental Protection Agency, Cincinnati, Ohio. Water Quality Office.
James W. Eichelberger, and James J. Lichtenberg.
Environmental Science and Technology, Vol 5, No 6, p 541-544, June 1971. 4 p, 2 tab, 11 ref.

Descriptors: *Persistence, *Pesticide kinetics, *Biodegradation, *Pesticide residues, *Chemical degradation, Chlorinated hydrocarbon pesticides, Rivers, Surface waters, Carbamate pesticides, Organophosphorus pesticides, Chemical analysis, Path of pollutants.
Identifiers: Pesticide persistence.

The persistence of 28 common pesticides in raw river water was studied over an eight-week period. Twelve organochlorine, nine organophosphorus, and seven carbamate pesticides were studied at a concentration of 10 micrograms/liter. No measureable degradation or chemical change was observed for the following organochlorine compounds: BHC, heptachlor epoxide, dieldrin, DDE, DDT, DDD, and endrin. Azodrin was the only organophosphorus compound that was stable throughout the study. All carbamate compounds were significantly changed after one week, and all but Baygon were completely lost after eight weeks. Where possible, the degradation or chemical conversion products of the pesticides were identified. (Knapp-USGS)

CHANGES IN THE CHEMICAL COMPOSITION OF SEDIMENTS OF LAKE WASHINGTON, 1958-1970,
Minnesota Univ., Minneapolis. Limnological Research Center; and Washington Univ., Seattle. Dept. of Zoology.
Joseph Shapiro, W. T. Edmondson, and David E. Allison.
Technical Report, 1971. 24 p, 1 tab, 22 ref. OWRR Project B-009-MINN (3).

Descriptors: *Water pollution effects, *Bottom sediments, *Eutrophication, *Water pollution control, *Washington, Phosphates, Nitrogen, Organic matter, Cores, Limnology, Nutrients, Water quality, Monitoring, Sampling, Data collections.
Identifiers: *Lake Washington.

Three cores were taken in deep water in different parts of Lake Washington in 1958 and 1959 and two cores were taken at one of the same locations in 1968 and 1970. During the interval between the two sets of cores, all the sewage effluent causing eutrophication of the lake was diverted, and the lake began to regress to a relatively unproductive condition. All the cores show higher concentrations of organic matter, phosphorus and nitrogen in the top few centimeters than deeper. Lake Washington is a particularly good subject for a study of this kind. Before 1963, as a result of continuing increases in sewage effluent entering it, the lake became more and more productive. Since 1963, as a result of a program of diversion of the effluents to Puget Sound, the lake has shown significant regression toward its earlier condition. Cores have been taken in a similiar fashion and in the same localities for about 12 years. (Knapp-USGS)

FORMATION OF METHYL MERCURY FROM PURE MERCURIC SULPHIDE IN AEROBIC ORGANIC SEDIMENT,
Swedish Water and Air Pollution Research Lab., Stockholm.
Torbjorn Fagerstrom, and Arne Jernelov.
Water Research, Vol 5, No 3, p 121-122, March 1971. 2 p, 1 fig, 3 ref.

Descriptors: *Heavy metals, *Poisons, *Sulfides, *Bottom sediments, *Metal organic pesticides, Path of pollutants, Water chemistry, Water pollution sources, Water pollution effects, Hydrogen sulfide, Chemical reactions, Water pollution control, Biochemistry.
Identifiers: *Mercury, *Methyl mercury.

The formation of methyl mercury from pure mercuric sulphide in aerobic organic sediments was studied. Methyl mercury is formed, but the speed of the methylation process is considerably lower compared to control series using inorganic divalent mercury. Periodic occurrence of hydrogen sulphide in bottom water and sediments is thus of importance for the turnover of mercury in an aquatic ecosystem. For restoring mercury-contaminated bodies of water the artificial binding of mercury as sulphide might be a possibility. At very high concentrations (over 500 ppm Hg) there is a decrease in the amount of methyl mercury formed due to the toxic effects of inorganic divalent mercury on the methylating organisms. In this situation mercury binding as mercuric sulphide might increase the methylation activity due to reduced toxicity. (Knapp-USGS)

WHERE DOES WATER QUALITY IMPROVEMENT BEGIN,
Agricultural Research Service, Beltsville, Md. Livestock Engineering and Farm Structures Research Branch.
Elmer E. Jones, Jr.
Ground Water, Vol 9, No 3, p 24-28, May-June 1971. 5 p, 5 fig, 10 ref.

Descriptors: *Groundwater movement, *Path of pollutants, *Water pollution sources, *Water wells, Malenclaves, Water sources, Domestic water, Well regulations.
Identifiers: Domestic well protection.

Most groundwater aquifers have a multibarrier natural defense system. With all these natural defenses, in most cases of contamination, the well itself is the path of entrance for the contamination. Only in very rare circumstances is it economically justified to substitute disinfection for adequate protection of a groundwater source. Rapid changes in well water quality with pumping time indicate less than optimum construction. Poorly constructed and abandoned wells serve as unauthorized and uncontrolled groundwater recharge points and have a degrading effect on groundwater quality. Water quality improvement should begin with excluding water of undesirable quality from the source of supply. For the home owner and farmer to profit from this ideal it must be accepted by well drillers, water conditioning dealers, and county and State healty departments. (Knapp-USGS)

FIELD STUDY OF SUBSURFACE SPENT SULFITE LIQUOR MOVEMENT USING EARTH RESISTIVITY MEASUREMENTS,
Research Council of Alberta, Edmonton. Earth Sciences Branch.
Douglas A. Hackbarth.
Groundwater, Vol 9, No 3, p 11-16, May-June 1971. 7 p, 2 fig, 7 tab.

Descriptors: *Path of pollutants, *Sulfite liquors, *Tracking techniques, *Electrical studies, *Seepage, Soil water movement, Groundwater movement, Geophysics, Tracers, Malenclaves, Waste disposal, Water pollution sources, Piezometers, Sampling, Water levels.
Identifiers: Earth resistivity studies.

A new method is presented for supplementing data from piezometers to monitor waste disposal sites. This method involves examination of a time sequence of resistivity measurements at fixed points in a disposal area. Spent sulfite liquor moving away from a seepage pit was traced by examining a grid of earth resistivity measurements made before and after dumping had taken place. The method appears to provide results which correlate with specific conducitivity of water samples from piezometers provided the following conditions are met: (1) highly conductive contaminant moving at shallow depth; (2) water table close to surface; (3) uniform soil and vegetative conditions; and (4) proper selection of electrode spacings. (Knapp-USGS)

POLLUTION PROBLEMS IN THE 'OIL PATCH',
Geological Survey, Denver, Colo.
John W. Rold.
American Association of Petroleum Geologists Bulletin, Vol 55, No 6, p 807-809, June 1971. 3 p, 1 fig, 2 ref.

Descriptors: *Water pollution sources, *Water pollution control, *Oil industry, *Oil fields, Injection wells, Oily water, Brines, Water wells, Monitoring, Path of pollutants.
Identifiers: Oil spills.

Throughout much of the 'oil path' water exemplifies the economic, sociologic, political, and ecologic lifeblood of the community. The permanent supply of usable water, on which the arid west depends for survival, faces many hazards. Currently, much available water exceeds or is rapidly approaching public health limits and the tolerance level of the inhtants. Oil field practices can and do pollute water, mainly by increasing total dissolved

solids (principally chlorides and sulfates), but also by releasing crude oil. Pollution may occur from several sources including evaporation pits, insufficient surface casing, abandoned wells, oil spills, and seismic shotholes. The solution of this problem requires a constant awareness of the value of fresh water, the habitat of groundwater, and the pollution potential of each operation. Constant planning, monitoring, and policing of the operation will not only prevent pollution, but will improve the industry's image and save oil companies money. (Knapp-USGS)

LAKE ERIE ALIVE BUT CHANGING,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
Dean E. Arnold.
The Conservationist, Vol. 25, No. 3, p. 23-30, Dec. - Jan 1970-71, 3 figures.

Descriptors: *Water pollution sources, *Pollution abatment, *Fisheries, Lake Erie.
Identifiers: Detroit River, Maumee River.

This article describes the problematic ecological situation into which Lake Erie has evolved, the causes of this condition, the effects of it and the possible solutions. The fisheries industry is a major focus of the article, suggesting ways for bringing it back to the lake as well as a detailed examination of what species of fish have been eliminated from Lake Erie and what new species have been introduced. The author concludes that 'if changes of some sort are not made in man's use and misuse of the Lake Erie resource, he will lose it entirely.' (Holmes-Rutgers)
W71-09409

STAGNANT SEA,
Goteborg Univ. (Sweden).
Stig H. Fonselius.
Environment, Vol. 12, No. 6, p 2-48 July/August 1970, 14 references.

Descriptors: *Water pollution sources, *International waters, *Economics, *Political aspects.
Identifiers: *Baltic Sea, International Council for Exploration of the Sea.

The Baltic Sea has been the object of scientific and economic interest for decades. It is an important trade waterway for seven countries in Northern Europe. This article describes the natural and man-made sources of pollution to the Baltic Sea and what the nations working together have already accomplished and plan to accomplish to control these pollutants. Although several 'fanciful suggestions,' as the author explains have been discussed, the political and economic aspects of any pollution control measures have to be carefully considered. (Holmes-Rutgers)

1969 FISH KILLS CAUSED BY POLLUTION (STATISTICAL REPORT).

For sale by the Superintendent of Documents, US Government Printing Office, Washington DC - Price $0.20. Federal Water Quality Administration, 1970. 20 p, 14 tab.

Descriptors: *Fishkill, *Water pollution effects, *Water pollution sources, Contamination (Water), Agricultural chemicals, Industrial wastes, Municipal wastes, Sewage effluents, Fertilizers, Mine wastes.

An estimated 41 million fish were killed by pollution in 1969, 15 million more than were killed in 1968. The Federal Water Quality Administration has compiled data on fish kills from every state except Hawaii, Nevada, North Dakota, Mississippi, and Maryland. Five general sources of pollution--agricultural operations, industrial operations, municipal operations, transportation operations, and other operations--are statistically related to the kills. The data is presented in the form of a data review, state kill report highlights, and fourteen fish kill tables. These tables depict an historical summary of kills, a summary of sources of pollution, a summary of kills by state, an analysis of types of water and seasonal incidence of kills, the severity of kills, and a cumulative listing of fish kills. EFFECTS OF INCREASED TEMPERATURE ON COLD-WATER ORGANISMS,
National Marine Fisheries Service, Seattle, Wash.
George R. Snyder, and Theodore H. Blahm.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 890-899. 6 fig, 3 tab, 26 ref.

Descriptors: *Aquatic environments, *Thermal pollution, Hydroelectric plants, Nuclear power plants, *Temperature, Anadromous fish, Salmon, Trout, Fishkill, Mortality, Nitrogen, Saturation, Metabolism, Flow, Spawning, Fisheries, Pacific Northwest U. S., Water pollution effects.
Identifiers: *Thermal block.

Many investigations dealing with laboratory tests performed on cold water fishsubjected to warmer waters have been reported. The mortality of fish subjected to warmer water is an accepted phenomena, but the mechanisms, in many instances, are still unknown. Also, no significant data has been compiled under actual stream conditions. Many of the aquatic organisms of the Pacific Northwest have been demonstrated to have low tolerance to the temperature increases, and much actual field research is needed to define more clearly the thermal tolerance and survival of these organisms over a wide range of environmental conditions. Predictions have been made for a 16-fold increase in electric power generating plants in this region, and without adequate controls and knowledge, waste heat discharges may destroy, debilitate, or dislodge, portions of the aquatic biota. On the other hand, waste heat discharge have also been shown to be beneficial in some instances, although the benefits are more likely to accrue to saltwater habitats, especially man-made canals ponds, and raceways, than to natural freshwater habitats. Increased understanding of temperature effects may remove harmful side effects and provide increased benefits in other areas. (Lowry-Texas)

NUTRIENTS AND NUTRIENT BUDGET IN THE BAY OF QUINTE, LAKE ONTARIO,
Ontario Water Resources Commission, Toronto.
M. G. Johnson, and G. E. Owen.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 836-853. 8 fig, 7 tab, 37 ref.

Descriptors: *Nutrients, *Nitrogen, *Phosphorus, Algae, *Eutrophication, Aquatic environments, Great Lakes, Bays, Watersheds (Basins), Surface drainage, Municipal wastes, Industrial wastes, Sampling, Water quality control, Cost analysis, Waste water treatment, Nutrient requirements.
Identifiers: Bay of Quinte, *Lake Ontario.

Algae blooms in the Bay of Quinte, Lake Ontario, have been increasing in severity and length over the past several years. Examination of aquatic life in the bay revealed an overwhelming predominance of organisms which readily function in organically rich waters. Input to the bay was monitored in 1968. During that time, the bay received 9.7 million lbs of nitrogen and 731,000 lbs of phosphates from all sources. Approximately 90% of the entering nitrogen entered via the rivers which empty into the bay, and these same rivers accounted for 60% of the phosphorus input. The remaining 10% of the nitrogen and 40% of the phosphorus was contributed from municipal-industrial sources. However, municipal-industrial flows are high strength low volume effluents which displace only a small volume of water from the lake. On the other hand, river flows are extremely low strength high volume additions to the bay which displace large volumes of water. Therefore, it was essential to consider the net additions of P and N rather than the total additions, the net addition being the amount of nutrient contained in an input which is in excess of the amount of nutrients contained in the volume of water displaced at the outlet. On this basis, 50% of the net nitrogen and 85% of the net phosphorus were contributed by municipal-industrial sources. Phosphorus removal from high concentration, low volume inputs, at a cost of $200,000 per year was recommended. (Lowry-Texas)

EFFECTS OF CADMIUM, ZINC, MANGANESE AND CALCIUM ON OXYGEN AND PHOSPHATE METABOLISM OF BLUEGILL LIVER MITROCHONDRIA,
Illinois Natural History Survey, Urbana, Ill.
Robert C. Hiltibran.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 818-823. 3 tab, 25 ref.

Descriptors: *Heavy metals, Fish, *Fish toxins, Chemical wastes, *Toxicity, Aquatic environments, Manganese, Oxygen, Calcium, Metabolism, Phosphates, Hydrolysis, Coagulation, Precipitation, Wildlife conservation, *Sunfishes.
Identifiers: *Mitochondria, Zinc, Cadmium.

Native wild bluegills were held in aerated aquaria, maintained at 25 deg C, for testing to determine the toxicity of various metal ions. Parameters monitored were the oxygen and phosphate uptake of the mitochondria. In the presence of succinic acid, oxygen uptake by the blue gill mitochondria was severely altered by: (1) 3.3 x 10-3 microns moles Cd ml of reaction medium; (2) 1.7 x 10-1 microns mole Ca/ml of reaction medium; and (3) 3.3 x 10-2 microns moles Zn/ml of reaction medium. In the presence of alpha-ketoglutaric acid, none of the metals had such a severe effect. However, 1.7 microns moles of Mn/ml of reaction medium inhibited oxygen uptake in the presence of both substrates. Cadmium and Zinc were found to increase the hydrolysis of adenosinetriphosphate by the mitochondria to a greater extent than either manganese or calcium. Previous investigators had speculated that deaths in fishes exposed to varying levels of lead, zinc, mercury, and copper were caused by coagulation or precipitation of mucus secreted by the gills, or damage to gill tissues. Research conducted here indicated that these effects may have been only secondary, and that the primary cause at death may be attributed to loss of energy production systems within the cells. (Lowry-Texas)
W71-08955

FISH TOLERANCE TO DISSOLVED NITROGEN,
New Mexico State Univ., University Park.

R. E. Speece, and W. E. Leyendecker.
New Mexico State University, Engineering Experiment Station, Technical Report, No 59, Nov 1969. 43 p, 7 fig, 11 tab, 7 ref, 2 append. OWRR Project A-018-NMEX (1).

Descriptors: *Fishkills, *Nitrogen, Pressure, *Trout, Saturation, Respiration, Aeration, Fish hatchery, Temperature, Chlorine, Dissolved oxygen, Oxygenation, Metabolism, Toxicity, Dininfection, Chromatography, Monitoring, Mixing, Fry, Water pollution effects, *Lethal limit.
Identifiers: *Goldfish, Dissolved nitrogen.

The tolerance to dissolved nitrogen of trout fingerlings and goldfish was compared in both pressurized and non-pressurized systems. The effect of the dissolved nitrogen on the rate of respiration of the fingerlings was also determined. Dissolved nitrogen concentrations as low as 100% of saturation caused trout fingerling mortality in the pressure system. This phenomenon was interesting since many well-aerated trout streams have 100% saturation concentrations of dissolved nitrogen. However, large numbers of bubbles were found on the specimens and the walls of the holding troughs, and it was speculalated that these bubbles were quite possibly the cause of the mortality. Both goldfish and trout lost equilibrium in the pressure system, but the goldfish floated and survived while trout died. Trout fingerlings were unable to tolerate 105% of dissolved nitrogen saturation for more than 4 1/2 days, while goldfish survived saturation concentrations of 140% for 48 hours, and 105% for 5 days. Goldfish in non-pressure systems were unaffected by saturations as high as 140% for 48 hours but in pressure systems, they lost equilibrium at 100% of dissolved nitrogen saturation in less than an hour. (Lowry-Texas)
W71-08960

EFFECT OF WATER TEMPERATURE ON NYMPHAL FEEDING RATE, EMERGENCE, AND ADULT LONGEVITY OF THE STONEFLY PTEROMARCYS DORSATA,
Environmental Protection Agency, Duluth, Minn. National Water Quality Lab.
Alan V. Nebeker.
Journal of the Kansas Entomological Society Vol 44, No 1, p 21-26, Jan 1971. EPA Program 18050 WAA 01/71.

Descriptors: *Water temperature, *Feeding rates, *Stoneflies, *Temperature, Water pollution effects, Insects, *Insect behavior, *Aquatic insects.
Identifiers: Pteronarcys dorsata.

The optimum and limiting temperatures for nymphal feeding, longevity of adults, number of eggs produced, and success of adult emergence were determined for the stonefly Pteronareys dorsata Newman (Pteronarcidae, Ptecoptera). The highest feeding rate occurred at 20C. No feeding occurred at 1C or 35C. The adults that emerged at 10C lived twice as long as those that emerged at 20C. None emerged at 5C or 25C. The best egg production occurred at 15C. The average adult life span was 17.5 days from nymphs reared at 20C, 31 days from nymphs held at 15C, and 36 days from larvae reared at 10C. (See also W71-08978) (Nebeker-EPA)
W71-08977

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
Environmental Protection Agency, Duluth, Minn. National Water Quality Lab.
Alan V. Nebeker.
Journal of the Kansas Entomological Society Vol 44, No 1, p 26-35, Jan 1971. EPA Program 18050--01/71.

Descriptors: *Water temperature, *Insect behavior, *Stoneflies, Seasonal distribution, Altitude, *Temperature, Water pollution effects, *Aquatic insects, Insects.
Identifiers: Plecoptera.

An analysis was made of the effects of temperature as influenced by altitude on the seasonal distribution and adult emergence of all winter stoneflies (Plecoptera) in a single stream. Water temperature of the stream, when modified by air temperature, solar insolation, snow cover, and springs produced significant changes in insect emergence patterns. RADIOACTIVE DEBRIS FROM UNDERGROUND NUCLEAR EXPLOSIONS. 1. PHYSICAL AND CHEMICAL CHARACTERISTICS. 2. BIOLOGICAL AVAILABILITY OF THE RADIONUCLIDES TO AQUATIC ANIMALS,
California Univ., Berkeley. Lawrence Radiation Lab.
Florence L. Harrison.
Available from the National Technical Information Service as UCRL-50596, $3.00 in paper copy, $0.95 in microfiche. Report UCRL-50596, Feb 7, 1969. 28 p.

Descriptors: *Marine animals, *Radionuclides, *Nuclear explosions, Absorption, Aquatic animals, Particle size, Suspension, Adsorption, Metabolism, Aquaria, Water pollution effects, Zinc radioisotopes, Leaching.
Identifiers: Cerium radioisotopes, Cesium radioisotopes, Manganese radioisotopes, Ruthemium radioisotopes, Zirconium radioisotopes, Antimony radioisotopes.

Aquatic animals can become contaminated by uptake of dissolved radionuclides or by radionuclides present in small partices that have been taken up by the animals. Radioactive debris from the chimney area of two contained underground nuclear explosions was characterized as to particle size, radionuclide concentration, leachability, and uptake in edible parts of freshwater and marine animals. Leachability of the debris radionuclides was determined in distilled water, synthetic pond water, synthetic sea water, and 1 molar ammonium acetate. Uptake by reshwater animals was rapid with Ce, Mn, Ru, Zn, and Zr; slow with Co, Cs, and Sb. Uptake by marine animals was rapid with Ce, Cs, Mn, Ru, and Zr; slow with Co, Sb, and Zn. Since the animals were exposed to the radionuclides for only short periods of time (1-3 weeks), the equilibrium uptake was probably not attained. Uptake was higher by freshwater than marine animals for Zn-65, but lower for Cs-137. (Bopp-NSIC)

STUDIES ON ZINC IN FRESHWATER ECOSYSTEMS,
Oberlin Coll., Ohio.
Edward J. Kormondy.
Available from the National Technical Information Service as COO-1499-3, $3.00 in paper copy, $0.95 in microfiche. Report COO-1499-3, Jan 1969. 32 p. Contract AT (11-1)-1499.

Descriptors: *Zinc radioisotopes, *Aquatic insects, *Aquatic plants, Aquatic environment, Ecosystems, Aquatic habitats, Dragonflies, Algae, Sediments, Soil-Water-Plant relationships, Nuclear wastes, Absorption, Chelation, Metabolism, Aquaria, Water pollution effects, Adsorption.
Identifiers: *Zinc.

Zinc-65 is significantly concentrated in the aquatic environment from nuclear wastes. The present experiments with microcosms (dragonfly larvae, algae, water, and soil) show a dependence of uptake on temperature, volume of the aquarium and light; which suggests that metabolic activity plays a role. In particular, uptake by aquatic plants was affected by photosynthesis. Only about 1% as much uptake by plants occurred in the presence of the chelating agent EDTA. Preliminary studies showed variations in chelation by soil between various soil types. The binding of zinc by soil was reduced by the presence of plants. (Bopp-NSIC)

BIOENVIRONMENTAL AND RADIOLOGICAL-SAFETY FEASIBILITY STUDIES, ATLANTIC-PACIFIC INTEROCEANIC CANAL, BIBLIOGRAPHY,
Battelle Memorial Inst., Columbus, Ohio.
A. W. Rudolph, T. E. Carroll, R. S. Davidson, and A. E. Waller.
Available from the National Technical Information Service as BMI-171-41, $3.00 in paper copy, $0.95 in microfiche. Report BMI-171-41, June 30, 1970. 231 p.

Descriptors: *Bibliographies, *Nuclear explosions, *Environmental effects, Excavation, Canal construction, Radioactivity effects, Radioisotopes, Absorption, Food chain, Rain forests, Aquatic life, Marine animals, Marine fish, Crop production, Panama Canal.

This bibliographic compilation has been prepared in support of two related research programs: the bioenvironmental and radiological-safety feasibility studies, Atlantic-Pacific interoceanic canal; and the possible effects of a sea level canal on the marine ecology of the American Isthmian region. Some of the major topics are, broadly stated: human, agricultural, forest, freshwater and marine ecology; and hydrological transfer processes. Abstracts are of the indicative type, intended to describe the content with details. Index terms are listed immediately following the abstract. (See also W71-099007 thru W71-09010) (Bopp-ORNL)

Available from the National Technical Information Service as BMI-171-25 and BMI-171-42, $3.00 each in paper copy, $0.95 each in microfiche. Abstracts, Report BMI-171-25, July 22, 1969. 275 p; Thesaurus, Report BMI-171-42, June 30, 1970. 129 p. Contract AT (26-1)-171.

Descriptors: *Marine fish, *Ecological distribution, *Canal Zone, Fish populations, Aquatic habitats, Marine fisheries, Oceanography, Tropical regions, Atlantic Ocean, Pacific Ocean, Canals, Ecology, Ecosystems, Mathematical models, Documentation, Abstracts.

These two reports consist of a compilation of 674 documents and a thesaurus, respectively. The compilation was made in support of the title research program, and an index to the abstracts was to be published as a third report. The major topics of the abstracts are: geological history of the isthmian region, flora and fauna of the eastern tropical Pacific and western Caribbean, physical and chemical oceanography of the isthmian region, present and potential fisheries, marine biology and ecology, mathematical modeling, distribution of species, life history information, and population dynamics. Descriptors: *Nuclear explosions, *Canals, *Marine fish, *Ecological distribution, Salinity, Turbidity, Resistance, Atlantic Ocean, Pacific Ocean, Feasibility studies, Information retrieval, Aquatic habitats.

An ecological study was conducted in connection with feasibility studies for the proposed sea-level canal. An information-retrieval system is presented for economically important fish species. It is predicted which species of fish are more likely to cross the canal and which are more likely to find a niche in the Atlantic. The species which show a wide range of tolerance of habitats, salinities, and turbidity are more likely to cross a canal. (See also W71-09006) (Bopp-NSIC)

HEALTH PHYSICS DIVISION ANNUAL PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1969: SYSTEMS ECOLOGY, WATERSHED AQUATIC HABITAT INTERACTIONS.
Oak Ridge National Lab., Tenn.

Available from the National Technical Information Service as ORNL-4446, $3.00 in paper copy, $0.95 in microfiche. Report ORNL-4446, (p 137-162), July 1969.

Descriptors: *Ecology, *Mathematical models, *Watershed management, Geochemistry, Lakes, Coniferous forests, Algae, Insects, Phosphorus radioisotopes, Technology, Natural resources, Ecological distribution, Stochastic processes, Ecosystems, Aquatic habitats, Water pollution effects.

The purpose of the ecological systems analysis program is to develop a methodology for making useful predictions about the outcome of environmental interactions. Progress is reported on the following projects: pertience of recent ecological literature to the modeling of ecosystems, biogeochemical ecology research collection, parameter identification in systems ecology, numerical methods in systems ecology, a versatile compartment system simulation program, a stochastic model of feeding in a forest centipede, a model for cedar bog lake (Minnesota), analysis of the change-in-ratio model for estimating population abundance, and systems analysis of balsam forests. The Walker Branch watershed project was organized to assess the potential ecological impact of new technology being applied to the field of natural resource management. A compartment model is illustrated for evaluation of transfer rates and characteristics of the transfer functions among the principal components of the watershed ecosystem. A material balance study using P-32 and periphytic algae in a closed system in the laboratory was conducted to obtain data on uptake and turnover of phosphorus by stream diatoms. (See also W71-09011) (Bopp-NSIC)

STUDY OF THE MANGANESE CYCLE IN FRENCH WATERS AND IN BRINE USING MN-54,
Aix-Marseille Univ. (France).
D. Asselin-Bagarry.
Available from the National Technical Information Service as NP-18395, $3.00 in paper copy, $0.95 in microfiche. Report NP-18395, Jun 1970. 199 p.

Descriptors: *Radioisotopes, *Absorption, *Aquatic life, *Sediments, Water pollution effects, Cycling nutrients, Trace elements, Radioecology, Salinity, Aquatic plants, Fish, Mollusks, Water pollution sources.
Identifiers: *Manganese radioisotopes.

Stages of manganese-54 in the food web were studied including: uptake by sediments, uptake by plants taking root in the sediment, uptake by crustaceans eating the plants, and uptake by fish eating the plants. Uptake by two species of aquatic plants reached saturation in ten days. Concentration factors were 30,000 to 80,000. Desorption in pure water occurred in two stages with periods of 1.5 and 17.5 days. Uptake by fish reached saturation in 9 days in fresh water; in 13 days in saline water. The slower desorption period was 47 days in fresh water; 63 days in saline water. (Bopp-NSIC)

RADIATION EXPOSURE TO MAN FROM DISPOSAL OF TRITIATED WATER VAPOR TO THE ATMOSPHERE,
Commissariat a l'Energie Atomique, Fontenay-aux-Roses (France). Centre d'Etudes Nucleaires.
Jacques Planet, Guy Uzzan, and Jacques Le Grand.
Available from the National Technical Information Service as CEA-CONF-1560, $3.00 in paper copy, $0.95 in microfiche. Report CEA-CONF-1560, 1970. 25 p. (Presented at the 2nd Congress of the International Radiation Protection Association, Brighton, England).

Descriptors: *Human population, *Milk, *Tritium, Radioactivity effects, Absorption, Nuclear wastes, Air pollution effects, Water pollution sources, Water pollution effects, Food chains, Soil contamination, Precipitation (Atmospheric).

The dispersion of tritiated water in the physical environment (dispersion in air, rainwater contamination, and ground contamination) is examined. Both contamination by inhalation of tritiated water vapor and ingestion of foods (drinking water, vegetables, and animal products) are considered. The method is applied to a plant, 3 km from a village, discharging tritiated steam through a stack. The yearly dose as a function of age of individuals is estimated. The study showed that in certain cases the dose through ingestion of milk is appreciable for infants. (Bopp-NSIC)

ECOLOGY OF PODON POLYPHEMOIDES (CRUSTACEA, BRANCHIPODA) IN THE CHESAPEAKE BAY,
Johns Hopkins Univ. Baltimore, Md. Chesapeake Bay Inst.
H. F. Bosch, and W. R. Taylor.
Available from the National Technical Information Service as NYO-3497-23, $3.00 in paper copy, $0.95 in microfiche. Report NYO-3497-23, May 1970. 77 p.

escriptors: *Crustaceans, *Plankton, *Ecology, ributaries, Biorhythms, Period of growth, Size, radation, Verticle migration, Water pollution ef-cts.
entifiers: Chesapeake Bay.

his species appears in the plankton in shallow ibutaries during the spring, declines during the mmer, resurges in autumn, and disappears during nter. Overwintering eggs hatch prior to both ring and fall peaks. The mid-bay population at-ins greatest densities within 11-26C, 8-18% linity, and greater than 2 ml/l of oxygen. Concen-ations are situated in the upper layers during the y, and in deeper water at night. (Bopp-ORNL)

PRELIMINARY BIBLIOGRAPHY OF ATHEMATICAL MODELING IN ECOLOGY,
k Ridge National Lab., Tenn.
V. O'Neill, J. M. Hett, and N. F. Sollins.
ailable from the National Technical Information rvice as ORNL-IBP-70-3, $3.00 in paper copy, 95 in microfiche. Report ORNL-IBP-70-3, Oct 70, 97 p.

scriptors: *Mathematical models, *Bibliogra-es, *Ecology, Documentation, Ecosystems, Pri-ry productivity, Plant populations, Dominant or-isms, Plant growth substances, Ecological dis-ution, Systematics, Secondary productivity, imal populations, Decomposing organic matter, osystem, Aquatic environment, Cycling rients, Drainage, Soil-water-plant relationships, ciation, Information retrieval, Simulation anal-, Optimization.

The techniques of mathematical modeling are expected to play a major role in the synthesis of data from the Deciduous Forest Biome Project. It was necessary to limit the scope of the bibliography in order to make it available as early in the program as possible. No attempt was made to review developments in systems analysis which have been reported in engineering or operations research journals. Also, no attempt was made to present the many kenetics models found in the physiological literature. Finally, the literature on the applications of statistics in ecology has been reviewed recently (Schultz, 1961) and these citations have been omitted. Instructions for preparing citations in a standard punch-card format are given in an appendix. (Bopp-NSIC)
W71-09025

AN INTRODUCTION TO THE NUMERICAL SOLUTION OF DIFFERENTIAL EQUATIONS IN ECOSYSTEM MODELS,
Oak Ridge National Lab., Tenn.
R. V. O'Neill.
Available from the National Technical Information Service as ORNL-IBP-70-4, $3.00 in paper copy, $0.95 in microfiche. ORNL-IBP-70-4, Dec. 1970. 29 p, 1 fig, 9 tab, 9 ref.

Descriptors: *Mathematical models, *Ecology, *Numerical analysis, Linear programming, Approximation method, Energy equation, Regression analysis.
Identifiers: Differential equations.

Four of the available numerical solution methods for differential equations are evaluated relative to their potential use in ecosystem models. A simplified energy flow model is used as an example. The Runge-Kutta method consistently emerged as reliable and efficient. Although the Euler method is simple, the user should be aware of the potential pitfalls which are associated with it. Use of a variable rather than a fixed value of the calculation interval h can greatly increase efficiency, and derivation of methods specifically designed for a particular problem can improve accuracy. Such refinements will be discussed in a future publication. (Bopp-NSIC)

HEATED EFFLUENT - AN ASSET TO AGRICULTURE,
Washington State Office of Nuclear Energy Development, Seattle.
L. B. Bradley.
Power Engineering, Vol. 73, No. 3, p. 52-62, March 1969.

Descriptors: *Beneficial use, *Thermal pollution, *Power plants, *State governments, *Water resources development, Planning, Agriculture, Effluent irrigation water, Economic feasibility, Columbia River, Oregon, Washington.

Can warm water from power plants be used for large-scale irrigation. The states of Washington and Oregon are trying to find out. These states will get their answers from a cooperative bi-state program, now underway. Essentially, the program has two parts: One is an irrigation experiment to determine the feasibility of using warm water. The second project is a multiple-use study to formulate an integrated water resource-agriculture-power generation system. The intent is to deliberately integrate the interests of water resource conservationists, the agricultural community and the power-producing entities. The goal is multiple usage of waters to serve the needs of all with minimum penalty to any. Both analytic and experimental approaches will be used, along with large-scale field research. (Houser-NSIC)

HYPERPLASIA IN AN ESTUARINE BRYOZOAN ATTRIBUTABLE TO COAL TAR DERIVATIVES,
National Museum of Natural Sciences, Ottawa (Ontario); and Washington State Shellfish Lab., Willapa Bay, Wash.
N. A. Powell, C. S. Sayce, and D. F. Tufts.
Journal of the Fisheries Research Board of Canada, Vol. 27, No. 11, p 2095-2098, 1970. 3 fig, 3 ref.

Descriptors: *Pathology, *Water pollution effects, *Coal tar coating, *Oily water, *Creosote, Oil, Oil wastes, Wood preservatives (Pesticides), Asphalt, Construction materials, Washington.
Identifiers: *Hyperplasia, *Bryozoans, Tumors, Invertebrate pathology, Carcinogens, Schizoporella sp., Willapa Bay.

Hyperplasia of bryozoan (Schizoporella unicornis) ovicells was noted in portions of Willapa Bay, Washington, where petroleum derivatives were in evidence. In one location, creosote, gasoline, and diesel and engine oil were present, while in another, asphalt-coated creosote was in use. Normal bryozoan colonies were transferred to these areas, and abnormalities occurred within 7-9 days. The authors suggest that this organism might be useful in monitoring estuarine waters for oil pollution. (LeGore-Washington)
W71-09036

THE TOXICITY OF FOUR INSECTICIDES TO FOUR SALMONID SPECIES,
Colorado State Univ., Fort Collins.
George Post, and Thomas R. Schroeder.
Bulletin of Environmental Contamination and Toxicology, Vol. 6, No. 2, p 144-155, 1971. 6 tab, 12 ref. Funded by Bur. of Sport Fishery and Wildlife, Fish Pesticide Research Lab. contract.

Descriptors: *DDT, *Endrin, *Carbamate pesticides, *Organophosphorous pesticides, *Chlorinated hydrocarbon pesticides, *Lethal limit, *Salmon, *Trout, Insecticides, Bioassy, Pesticide toxicity, Fishkill, Mortality, Salmonids, Fish diseases, Fish physiology, Fish toxins, Toxicity.
Identifiers: *Malathion, *Carbaryl, TL-m, Salvelinus sp., Salmo sp., Oncorhynchus sp., Water pollution effects.

A study was conducted to determine the relative toxicity of four commonly used insecticides (DDT, endrin, carbaryl and malathion) to four salmonid fishes commonly used for experimentation. Standard static bioassay procedures were followed. Ninety-six hour TL-m values differ from those in previously published literature. This, it is concluded, is related to any of several variables, e.g. body weight, water quality, fish strain and physical factors. Susceptibility to the various pesticides was definitely species or strain dependent. Carbaryl was generally the least toxic of the four insecticides. (LeGore-Washington)
W71-09037

EFFECT OF PINE LITTER ON QUALITY OF WATER RECEIVED BY SMALL FISHING IMPOUNDMENTS,
Arizona Univ., Tucson. Arizona Cooperative Fishery Unit.
William Seawell, George Adams, and William J. McConnell.
Journal of the Arizona Academy of Sciences, Vol. 5, No. 4, p 263-270, 1969. 2 fig, 6 tab, 20 ref.

Descriptors: Water pollution effects, *Ponderosa pine trees, *Small watersheds, *Runoff, *Leaching, Water quality, Arizona, Temperature, Phenols, Color, Chemical oxygen demand, Carbohydrates, Detritus, Decomposing organic matter.
Identifiers: *Pine litter, *Pine needles, Rose Canyon Lake (Ariz).

From the evidence presented, it does not appear that the organic compounds leached from the Ponderosa Pine needles commonly have a conspicuously beneficial (e.g. trophic) or detrimental

(e.g. oxygen demand, toxicity) effect on the animal community of small water impoundments. This does not, however, rule out the low level, chronic toxicity produced by tanning and/or by related phenolic compounds. Light reduction due to litter-strained runoff may limit primary productivity, which may in turn affect fish production. (Wahtola-Washington)
W71-09038

TOXICITY TESTS WITH OIL DISPERSANTS IN CONNECTION WITH OIL SPILL AT CHEDABUCTO BAY, NOVA SCOTIA,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
John B. Sprague, and William G. Carson.
Fisheries Research Board of Canada, Technical Report No. 201, 1970. 30 p. 5 fig, 2 tab, 4 ref.

Descriptors: *Oily water, *Bioassay, *Lethal limit, *Emulsions, *Emulsifiers, *Toxicity, *Detergents, *Water pollution effects, Oil, Oil wastes, Dispersion, Colloids, Bioindicators, Mortality, Pollution abatement, Water pollution control, Toxins, Non-structural alternatives, Water treatment, Lobsters, Salmon.
Identifiers: *Oil pollution, *Bunker oil, *Corexit 8666, BP 1002, Flounder, Pseudopleuronectes sp., Homarus sp., Salmo sp.

The authors report the results of preliminary screening of several Bunker C oil dispersants for acute toxicity to small salmon (Salmo salar) in fresh water and to winter flounder (Pseudopleuronectes americanus) and lobsters (Homarus americanus) in sea water. Dispersants tested in static bioassays included Corexit 8666, BP 1100B, BP 1100, BP 1002, Gulf Agent 1009, naphtha gas, Dispersant 88, Dispersol SD and XZIT x-1-11. Corexit 8666 appeared to be the least toxic to all organisms, but it is cautioned that an apparent toxicity during degradation should be investigated before this compound is recommended for wide scale use. Five appendices supply detailed test data, holding conditions for test animals, a discussion of toxic degradation products of Corexit 8666, notes on autopsies, and notes on the appearance of test mixtures. (LeGore-Washington)

A REVIEW OF POSSIBLE CAUSES OF MORTALITY OF OYSTER LARVAE OF THE GENUS CRASSOSTREA IN TOMALES BAY, CALIFORNIA,
University of the Pacific, Dillon Beach, Calif. Pacific Marine Station.
Carl J. Berg, Jr.
California Fish and Game, Vol. 57, No. 1, p. 69-75, 1971. 35 ref.

Descriptors: *Larvae, *Oysters, *Turbidity, *Sediments, *Mortality, *Food abundance, Life cycles, Mollusks, Temperature, Salinity, Hydrogen ion concentration, Silts, Organic compounds, Trophic level, Dinoflagellates, Red tide, Diseases, Water pollution effects, California.
Identifiers: Setting, *Spatfall, Cultch, Sedimentation, Spat, Tomales Bay (Calif).

The inability of oysters (Crassostrea sp.) to produce successive generations in Tomales Bay can be attributed to failure of larval survival and set, since the adults do spawn. No single factor is held accountable for the absence of oysters spat. Lack of proper food and nutrients probably is a very important factor. In Tomales Bay, extreme turbidity is responsible for larval loss because all possible places where oyster larvae may settle are soon covered with a layer of mud. Blooms of dinoflagellates are the third major cause of larval mortality. Other causes are not likely to be as important as these three, but they do contribute to generally unfavorable conditions for oyster larvae in this bay. (LeGore-Washington)
W71-09041

THE EFFECTS OF OIL POLLUTION AND CLEANING ON SALT MARSH ECOLOGY,
Field Studies Council, Pembroke (England). Oil Pollution Research Unit.
J. M. Baker.
Field Studies Council, Oil Pollution Research Unit, Orielton Field Centre, Annual Report, 1969, p 3-26. 16 fig, 18 ref.

Descriptors: *Oil, *Oily water, *Emulsions, *Emulsifiers, *Toxicity, *Water pollution treatment, Water pollution effects, *Salt marshes, *Tidal marshes, *Coastal marshes, *Marsh plants, *Resistance, Oil wastes, Bioassay, Dispersion, Bioindicators, Detergents, Mortality, Pollution abatement, Pathology, Path of pollutants.
Identifiers: *Oil pollution, *Oil spills, *Chronic pollution, Spartina sp., Recovery.

The author concisely summarizes two years of investigation of the effects of oil pollution, both acute and chronic, on salt marsh plants. Effects and phytopathological mechanisms of emulsifiers in general are discussed. It is concluded that salt marshes are quite resistant to isolated incidents, relative to permanent damage, but that chronic oil pollution can kill all vegetation. The degree of recovery ability, however, is not definitively known. It is recommended that oiled salt marshes should be left untreated, at least until more efficacious methods are available. (LeGore-Washington)

THE BIOLOGICAL EFFECTS OF MARINE OIL POLLUTION AND SHORE CLEANSING,
Field Studies Council, Pembroke (England). Oil Pollution Research Unit.
Geoffrey B. Crapp.
Field Studies Council, Oil pollution Research Unit, Orielton Field Centre, Annual Report, 1969, p 27-42. 9 fig, 15 ref.

Descriptors: *Oil, *Oily water, *Emulsifiers, *Toxicity, *Water pollution treatment, Water pollution effects, *Snails, *Mussels, Oil wastes, Bioassay, Emulsions, Dispersion, Bioindicators, Detergents, Mortality, Resistance, Mollusks, Intertidal areas, Shores, Shore protection.
Identifiers: *Oil pollution, *Chronic pollution, *Oil spills, *Barnacles, Repopulation, Recovery, Limpets, Rocky shores.

This report summarizes results in in situ experimentation concerning effects of oil, primarily Kuwait crude and Kuwait atmospheric residue, on shore life, especially barnacles and mollusks. Treatment of shore plots with the emulsifier, BP 1002, was concurrently studied. Laboratory bioassays challanging limpets, mussels and snails with graded concentrations of emulsifiers are also discussed. Recovery of Hazelbeach and Llanreath shores following detergent-cleaning is described, as are ecological effects of oil spillage and of chronic pollution by refinery effluents. (LeGore-Washington)
W71-09044

MICRO-RESPIROMETRY AND EMULSIFIER TOXICITY,
University Coll. of Swansea (Wales).
A. Nelson-Smith.
Field Studies Council, Oil Pollution Research Unit, Orielton Field Centre, Annual Report, 1969, p 43-47. 2 fig, 5 ref.

Descriptors: *Bioassay, *Emulsifiers, *Toxicity, *Water pollution treatment, *Water pollution effects, *Enzymes, *Inhibitors, *Analytical techniques, Emulsions, Bioindicators, Detergents, Resistance, Pollutant identification, Respiration.
Identifiers: *Oil pollution, Respirometer, Microrespirometer.

The Gilson microrespirometer (a Warburg respirometer refinement) was used in an attempt to devise a rapid method of comparing emulsifier toxicities and in a preliminary investigation of the effects of emulsifiers on some enzymes of the tricarboxylic-acid cycle. Emulsifers were tested against standard suspensions of baking yeast. Commercial quality BP 1002 depressed oxygen uptake to a greater degree than did BP 1002 in an experimental, more aliphatic solvent (Blend Y). BP 1100 appeared even less toxic. Crab muscle succinic dehydrogenase and oxoglutarate dehydrogenase were greatly inhibited by BP 1002, while no change in fumarase activity was noted. Isocitric dehydrogenase was unaffected. (LeGore-Washington)
W71-09045

EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
Bureau of Commerical Fisheries, Milford, Conn; and Maryland Univ., Solomons. Natural Resources Inst.
Harry C. Davis, and Herbert Hidu.
U. S. Fish and Wildlife Service, Fishery Bulletin, Vol 67, No 2, p 393-404, 1969. 1 fig, 2 tab, 11 ref.

Descriptors: *Pesticides, *Insecticides, *Herbicides, *Nematocides, *Bactericides, *Fungicides, *Algicides, Water pollution effects, Lethal limit, *Pesticide toxicity, Bioassay, *Clams, *Oysters, *Growth rates, Pesticide drift, Toxicity, Mollusks, Mortality, Embryonic growth stage.
Identifiers: Survival, Growth, *Embryonic development, Morphological effects, Embryo, Development, Morphology (Animal), Mercenaria sp., Crassostrea sp.

Fifty-two compounds were tested for their effects on embryos of the hard clam, Mercenaria mercenaria, and of the American oyster, Crassostrea virginica, and on their larvae. The pesticides included 17 insecticides, 12 herbicides, one nematocide, four solvents, and 18 miscellaneous bactericides, fungicides and algicides. Most of the compounds affected normality of embryonic development more than survival or growth of larvae. Some, however, drastically reduced growth of larvae at concentrations that had relatively little effect on embryonic development. It is necessary, therefore, to evaluate the effects of pesticides on all stages of the life cycle of an organism before the pesticide can be considered safe. Nevertheless, differences in toxicity to bivalve larvae among the compounds of each category of pesticide are large enough that it should be possible to select compounds to control pest species without serious damage to commercial shellfish. (LeGore-Washington)

DYNAMICS OF MS-222 IN THE BLOOD AND BRAIN OF FRESHWATER FISHES DURING ANETHESIA,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
Joseph B. Hunn.
U. S. Fish and Wildlife Service, Bureau of Sport Fisheries and Wildlife, Investigations in Fish Control series, No 42, 1970. 11 p, 3 tab, 11 ref.

Descriptors: *Fish physiology, *Path of pollutants, Water pollution effects, *Fish control agents, *Fish management, *Absorption, Analytical techniques, Bioassay, Colorimetry, Color reactions, Laboratory tests, Fish farming, Fish handling facilities, Freshwater fish, Pathology.
Identifiers: Fish handling, MS-222, *Anesthetics, Fish anesthetics, Drugs, Nervous tissue, Brain tissue.

Eleven species of freshwater fishes were rapidly anethetized in solutions of MS-222 (methanesulfonate of meta-aminobenzoic acid ethyl ester) containing 100-1,000 mg of MS-222 per liter. MS-222 concentrations in blood and brain after one minute exposure indicate that MS-222 rapidly diffuses across the gill and passes the blood-brain barrier. Acetylated MS-222 was detected in the blood of all species studied, indicating that the drug is metabolized. The concentration of free MS-222 in

e brain increased with depth of anesthesia to loss reflex and then either increased or declined ghtly as the fish approached medullary collapse. eGore-Washington)

ke Powell Quality Studies for the Navajo Plant,
chtel Inc., San Francisco, Calif; and Arizona te Univ., Tempe.
S. Riesbol, W. L. Minckley, and R. F. Kilmartin.
per, American Society of Civil Engineers, Na-nal Water Resources Engineers Meeting, oenix, Ariz, Jan 1971. 59 p, 11 fig, 3 tab, 30 ref, pend.

escriptors: *Water quality, Water pollution, alinity, Lakes, Fish, Investigations, Aquatic life, mnology, Hydrology, Climatology, Water tem-rature, Air temperature, Bibliographies, Inflow, issolved solids, Reservoir operation, Stratified w, Public opinion.
entifiers: Lake Powell, Navajo Powerplant, Ariz, lorado River.

ter quality investigations were made at Lake well to provide the basis for design of cooling ter facilities for the Navajo steam electric erating station. The Navajo station cooling vers would have a total waterflow of 1,620,000 /min with an annual makeup requirement of ,000 acre-ft at an average rate of 50 cfs. Under scheme considered, 4,500 acre-ft of blowdown ter would be discharged annually from the cool-towers at an average rate of 6 cfs after 6 con-trations. The investigation was to determine at adverse effects the blowdown water would ve on the aquatic environment of Lake Powell if blowdown water were returned to the lake with additional treatment. Although the study in-ated no adverse effects of such an arrangement, ections were raised to even nominal increases in inity by downstream interests and water quality trol agencies. The report contains water quality dies focused primarily on the lower 15 mi of the e, but necessarily includes an overall view of the e behavior. (USBR)

RESIDUES OF TOTAL MERCURY AND METHYLMERCURIC SALTS IN LAKE TROUT AS A FUNCTION OF AGE,
Cornell Univ., Ithaca, N.Y. Pesticide Residue Lab.
C. A. Bache, W. H. Gutenmann, and D. J. Lisk.
Science, Vol 172 No 3986, p 951-952, May 28, 1971. 2 p, 1 fig, 1 tab, 7 ref.

Descriptors: *Lake trout, *Heavy metals, *Poisons, *Metal organic pesticides, Water pollution sources, Aquatic life, Environmental effects, Trout, Freshwater fish, New York, Water pollution effects.
Identifiers: *Heavy metal poisons, *Mercury, Cayuga Lake (N.Y.).

To relate mercury concentrations to time of exposure of fish, an analysis of the concentration of total mercury and methylmercuric salts in lake trout of precisely known ages from 1 to 12 years has been carried out. Trout from Cayuga Lake, Ithaca, New York, which are tagged and stocked annually as fingerlings, were netted in October 1970 to obtain samples of as many different ages as possible. Mercury can reach the lake from its use in laboratory research, in dental and medical services, in agriculture, in coal burnt in powerplants, and from other sources. The concentrations of both total mercury and methylmercury were found to increase with age of the fish but were not related to the fish sex. A data table presents a list of concentrations of total mercury and methylmercury in the fish by age and the percentage of total mercury that was present as methylmercury. (Lang-USGS)

EUTROPHICATION OF SHELTERED BAYS IN A LARGE LAKE,
Utah State Univ., Logan. Center for Water Resources Research.
William T. Helm.
Available from the National Technical Information Service as PB-200 259, $3.00 in paper copy, $0.95 in microfiche. Center for Water Resources Research, Utah State University, Final Report (undated). 53 p, 6 fig, 5 tab, 55 ref. OWRR Project B-010-UTAH (1).

Descriptors: *Eutrophication, *Lakes, *Bays, Circulation, Distribution, Particle size, Invertebrates, Currents (Water), Nutrients, Oxygen, Respiration, Biological communities, Clays, Environment, Silts, Organic matter, Diptera.
Identifiers: *Sheltered bays, Tanytarsus, Polypedilum, Tendipes, Ordination analysis.

Objectives of this investigation were to determine the quantity and quality of influent in bays or breakwater areas of Bear Lake, Utah-Idaho, and to appraise biological responses to water quality of the bays. Three partially completed studies disclosed the importance of the median grain size of sediments, contents of silt and clay and organic matter, the velocity of currents, and concentration of oxygen near the bottom. The results were subjected to ordination analyses. The structure of communities was influenced by environmental conditions. The median grain size of 0.20 mm is of critical importance for the distribution of benthic invertebrates. The continuum of some chironomids was indicative of the community type and environment. Only three species of chironomids, Tanytarsus A, Polypedilum digitifer, and Tendipes, were present in numbers sufficient to be utilized in production studies. The density of Tanytarsus was indirectly related to silt and clay and organic matter content of the bottom. (Wilde-Wisconsin)

OXYGEN PRODUCTION IN SOME NORTHERN INDIANA LAKES,
Manchester Coll., North Manchester, Ind. Dept. of Biology.
William R. Eberly.
Proceedings of the Industrial Waste Conference 17, p 733-747, 1963. 5 fig, 6 tab, 3 ref.

Descriptors: *Oxygen, *Indiana, *Lakes, *Dissolved oxygen, Hypolimnion, Biota, Productivity, Measurement, Metabolism, Profiles, Stratification, Seasonal, Oligotrophy, Eutrophication, Nutrients, Temperature, Photosynthesis, Diffusion, Respiration, Decomposing organic matter, Light, Turbulence, Epilimnion, Thermocline, Winds, Solar radiation, Carbon dioxide, Hydrogen ion concentration.
Identifiers: *Oxygen production, Orthograde oxygen curves, Myers Lake (Ind), McLish Lake (Ind), Taylor Lake (Ind), Meso-orthograde, Plus-heterograde, Meso-clinograde, Clinograde oxygen curves, Mesotrophic, Metalimnion, Morphometry.

An oxygen profile, depicting vertical distribution of dissolved oxygen, is a significant diagnosis of lake character; profiles indicating lake metabolisms strikingly develop during summer stratification, showing lake differences. Orthograde, meso-orthograde, clinograde, meso-clinograde, and plus-heterograde oxygen curves are described. Temperature and light affect oxygen concentration in the greatest variety of ways. Stratification may develop with a warm surface layer overlying the cold bottom layer, the plane of maximum temperature change being the thermocline; oxygen below the epilimnion may accumulate to high concentrations. Transparency of a lake is both cause and effect of its particular productivity pattern. In addition to plankton concentration, transparency varies with turbidity and color. Relation of transparency and production in different lake types is expressed graphically and mathematically. Oxygen production curves are given for three lakes. Some anomalous results indicate that Oscillatoria agardhii may subsist in absence of visible light (or at extremely low intensities) by some chemosynthetic process, perhaps releasing free oxygen. Since Oscillatoria utilizes sulfates, possibly a sulfate deficiency is a limiting factor in production of a deep-water oxygen maximum produced by Oscillatoria. (Jones-Wisconsin)

JAMES RIVER-WILSON CREEK STUDY, SPRINGFIELD, MISSOURI.
Federal Water Pollution Control Admin., Robert S. Kerr Water Research Center, Ada, Okla.

Vol 1, June 1969. 60 p, 14 fig, 2 tab, 23 ref.

Descriptors: *Water pollution effects, *Water pollution control, *Water pollution sources, *Fishkill, Storm runoff, Odor, Subsurface runoff, Groundwater movement, Limestones, Infiltration, Domestic wastes, Benthic fauna, Industrial wastes, Drainage, Aquifers, Sinks, Cities, Sewage treatment, Sewers, Aeration, Monitoring, Landfills, Biochemical oxygen demand, Chemical oxygen demand.
Identifiers: *Urban storm runoff, James River (Mo), Wilson Creek (Mo), Springfield (Mo), Sewage plant bypasses.

Fish kills, associated with storm runoff, and odorous and unsightly conditions in Wilson Creek which flows past Springfield (Mo) and the Wilson's Creek Battlefield National Park prompted investigation. Thunderstorms caused Wilson Creek to dominate flow at point of confluence with the James River. Since the area is underlain with limestone, significant volumes of surface and waste water enter the upper groundwater aquifers through numerous sinkholes and crevices, some of which are in the Wilson Creek bed. This water, passing through a maze of fractures and solution channels in the limestone, often reappears in degraded condition. Possible pollution causes were sewage treatment plant bypasses (especially following rains), scouring of sludge deposits, industrial waste discharges, storm runoff from Springfield, and slugs of poor quality subsurface water from Rader Spring entering surface waters. Recommendations are storm runoff control, sewage treatment plant improvement, improvement of industrial waste treatment facilities, effort to restore Rader Spring to high quality, attempt to preclude pollution of groundwater aquifers, construction of a reservoir on the James River for flow augmentation, and establishment of a monitoring system. History, description of problems and discussion are included. (Jones-Wisconsin)
